**DATA-F-D-1.0 INTRODUCTION**

1  
2 The calculations for the packaging material densities (also referred to as container material  
3 densities) for steel, plastic, or lead present in each type of transuranic (TRU) waste container that  
4 will to be shipped to the Waste Isolation Pilot Plant (WIPP) are based on packaging assumptions  
5 found in the Transuranic Waste Baseline Inventory Report (TWBIR), Revision 2, Chapter 1  
6 (DOE 1995) on data documented in the TRUPACT-II Authorized Methods for Payload Control  
7 (NRC 2003), and a pending revision to the TRAMPAC (DOE 2002). Additional details  
8 concerning waste material parameters or packaging materials can be found in the documents  
9 listed in Attachment F, Table-DATA-F-1. This annex describes how packaging material  
10 densities are determined for sites where limited or no information was provided.

11 This annex consists of two parts. In the first part, the general packaging material densities are  
12 given for directly loaded containers including 55-gallon drums, 85-gallon drums, 100-gallon  
13 drums, and standard waste boxes (SWBs). This part also includes the methods used to determine  
14 the packaging material densities when waste containers are overpacked, such as four 55-gallon  
15 drums overpacked in an SWB or ten 55-gallon drums overpacked in a ten-drum overpack  
16 (TDOP). These general methods are based on TWBIR, Revision 2 and the TRAMPAC. The  
17 calculations to estimate the packaging material densities in kilograms per cubic meter ( $\text{kg/m}^3$ )  
18 are presented in Section DATA-F-D-2.0.

19 The second part of this annex summarizes the methods used to calculate and document  
20 packaging material densities that were done on a site-by-site basis. These summaries are based  
21 on several "Routine Calculations" that were developed and documented under Sandia National  
22 Laboratories (SNL) Nuclear Waste Management Program Procedure, NP 9-1, Analyses. These  
23 routine calculations were conducted after a thorough review of the inventory data revealed that  
24 some waste streams required modification to allow for shipping container volume. For example,  
25 some sites reported the current packaging configuration of their waste streams instead of the  
26 configuration that the waste would be in when shipped and disposed in the WIPP. Although this  
27 information was accurate and complete, the result was that the waste volumes reported did not  
28 truly reflect the volume the waste will occupy when disposed in the WIPP. Waste volume  
29 accuracy in this regard is vital for the Performance Assessment (PA) calculations in support of  
30 the Compliance Recertification Application (CRA). The routine calculations serve to repair this  
31 discrepancy in the volumes and apply the new volumes to the waste and packaging material  
32 densities and the radionuclide concentrations. The methods used to estimate the packaging  
33 material densities in  $\text{kg/m}^3$  are summarized in Section DATA-F-D-3.0 below, with reference to  
34 the actual routine calculations by SNL WIPP Records Center, Electronic Records Management  
35 System (ERMS) number.

1                   **DATA-F-D-2.0 GENERAL PACKAGING MATERIAL DENSITIES**

2   **DATA-F-D-2.1 Packaging Material Densities for a Directly Loaded 55-Gallon Drum**

3   ***DATA-F-D-2.1.1 Steel***

4   A 55-gallon drum is made of steel and weighs 27 kg (60 lbs) (NRC 2003). The density of steel  
5   for the drum is calculated as follows:

$$6 \quad \text{Density of Steel} = \frac{60 \text{ lbs} / (2.205 \text{ lbs/kg})}{0.208 \text{ m}^3 \text{ per drum}} = 131 \text{ kg/m}^3.$$

8   ***DATA-F-D-2.1.2 Plastic***

9   The rigid liner in a 55-gallon drum weighs 7.7 kg (17 lb) (DOE 1995). The density of plastic  
10   packaging in a 55-gallon drum is calculated as follows:

$$11 \quad \text{Density of Plastic} = \frac{7.7 \text{ kg}}{0.208 \text{ m}^3} = 37 \text{ kg/m}^3.$$

13   **DATA-F-D-2.2 Packaging Material Densities for a Directly Loaded 85-Gallon Drum**

14   Directly loaded 85-gallon drums are not compliant with the current TRAMPAC (NRC 2003), but  
15   are expected to be compliant with the next revision of the TRAMPAC. A request was submitted  
16   to the Nuclear Regulatory Commission (NRC) in October 2002 to approve directly loaded 85-  
17   gallon drums as payload containers as part of the CH TRAMPAC Revision 1 (DOE 2002).  
18   Therefore, the directly loaded 85-gallon drums will be considered here.

19   Additionally, the TRAMPAC, Revision 1 (DOE 2002) used the term “85-gallon drum” to refer  
20   to “drums with a range of dimensions yielding 75 to 88 gallons.” Therefore, this calculation  
21   applies to all drums between 75 and 88 gallons.

22   ***DATA-F-D-2.2.1 Steel***

23   The weight of the 85-gallon drum is 37 kg (81 lbs) (DOE 2002). The volume of an 85-gallon  
24   drum is 0.322 m<sup>3</sup>. The density of steel for the 85-gallon drum is calculated as follows:

$$25 \quad \text{Density of Steel} = \frac{81 \text{ lbs} / (2.205 \text{ lbs/kg})}{0.322 \text{ m}^3 \text{ per 85-gallon drum}} = 114 \text{ kg/m}^3.$$

27   ***DATA-F-D-2.2.2 Plastic***

28   It is assumed that no plastic liners are used. Therefore, the value used for the plastic packaging  
29   material is 0.0 kg/m<sup>3</sup>.

1 **DATA-F-D-2.3 Packaging Material Densities for a Directly Loaded 100-Gallon Drum**

2 The 100-gallon drum is currently authorized for shipment in the TRUPACT-II (NRC 2003) and  
3 will be added as an authorized payload container for the HalfPACT (DOE 2002).

4 **DATA-F-D-2.3.1 Steel**

5 The weight of a steel, 100-gallon drum is 43 kg (95 lbs) (NRC 2003). The volume of a 100-  
6 gallon drum is 0.379 m<sup>3</sup>. The density of steel for the 100-gallon drum is calculated as follows:

7 
$$\text{Density of Steel} = \frac{95 \text{ lbs} / (2.205 \text{ lbs/kg})}{0.379 \text{ m}^3 \text{ per 100-gallon drum}} = 114 \text{ kg/m}^3.$$

9 **DATA-F-D-2.3.2 Plastic**

10 It is assumed that no plastic liners are used. Therefore, the value used for the plastic packaging  
11 material is 0.0 kg/m<sup>3</sup>.

12 **DATA-F-D-2.4 Packaging Material Densities for a Directly Loaded Standard Waste Box**

13 **DATA-F-D-2.4.1 Steel**

14 An SWB is made of steel and weighs 290 kg (640 lbs) (NRC 2003). The volume of an SWB is  
15 1.89 m<sup>3</sup>. The amount of steel is calculated as follows:

16 
$$\text{Density of Steel} = \frac{640 \text{ lbs} / (2.205 \text{ lbs/kg})}{1.89 \text{ m}^3 \text{ per SWB}} = 154 \text{ kg/m}^3.$$

18 **DATA-F-D-2.4.2 Plastic**

19 The plastic liner in a directly loaded SWB weighs approximately 2.25 kg (5 lbs) (DOE 1995).  
20 The plastic packaging density in a directly loaded SWB is calculated as follows:

21 
$$\text{Density of Plastic} = \frac{2.25 \text{ kg}}{1.89 \text{ m}^3} = 1.2 \text{ kg/m}^3.$$

23 **DATA-F-D-2.5 Packaging Material Densities for a Directly Loaded Remote-Handled-  
24 Transuranic Waste Canister**

25 There are two remote-handled (RH)-TRU waste canister designs available for use by the  
26 generator sites. One contains lead, the other does not. Since it is uncertain which canister will  
27 be used, this calculation uses the same assumption as that for the TWBIR Revision 2 (DOE  
28 1995), and lead is included as packaging material for RH-TRU waste canisters.

1 **DATA-F-D-2.5.1 Steel**

2 The total weight of an empty RH-TRU waste canister is 799 kg (1,762 lbs), of which 386 kg  
 3 (852 lbs) is steel and 413 kg (910 lbs) is lead (DOE 1995). This does not include the shield plug  
 4 (included in emplacement materials). The volume of the RH-TRU waste canister is 0.89 m<sup>3</sup>.

5 The density of steel for the RH-TRU waste canister is:

6           Density of Steel =  $\frac{852 \text{ lbs}/(2.205 \text{ lbs/kg})}{0.89 \text{ m}^3 \text{ per RH-waste canister}}$  = 434 kg/m<sup>3</sup>.  
 7

8 **DATA-F-D-2.5.2 Plastic**

9 For a directly loaded RH-TRU waste canister, it is assumed there would be no plastic packaging  
 10 involved. Therefore, the amount of plastic for this case is zero.

11 **DATA-F-D-2.5.3 Lead**

12 The weight of lead in the RH-TRU waste canister is 413 kg (910 lbs) (DOE 1995), and the  
 13 volume is 0.89 m<sup>3</sup>. The density of lead is calculated as follows:

14           Density of Lead =  $\frac{910 \text{ lbs} / (2.205 \text{ lbs/kg})}{0.89 \text{ m}^3 \text{ per RH-waste canister}}$  = 464 kg/m<sup>3</sup>.  
 15

16 **DATA-F-D-2.6 Packaging Material Densities for a Standard Waste Box Used to Over-**  
 17 **Pack Four 55-Gallon Drums**

18 **DATA-F-D-2.6.1 Steel**

19 For the case of four 55-gallon drums overpacked in an SWB, the total weight of steel is a  
 20 combination of the steel in the SWB and the steel in the 55-gallon drums. The weight of a 55-  
 21 gallon drum is 27 kg (60 lbs) and the weight of an SWB is 290 kg (640 lbs) (NRC 2003). The  
 22 density of steel for the SWB with four 55-gallon drums in it is calculated as follows:

23           Density of Steel =  $\frac{(4 \text{ drums} \times 60 \text{ lbs steel per drum} + 640 \text{ lbs})}{1.89 \text{ m}^3 \text{ per SWB}}$  = 211 kg/m<sup>3</sup>.  
 24

25 **DATA-F-D-2.6.2 Plastic**

26 It is assumed that the plastic liner for the SWB will not be used when the drums are overpacked  
 27 in the SWB. Thus, the plastic will be contributed entirely by the rigid liners in the four  
 28 overpacked drums. The density of plastic packaging is:

29           Density of Plastic =  $\frac{4 \text{ drums} \times 7.7 \text{ kg of plastic per drum}}{1.89 \text{ m}^3 \text{ per SWB}}$  = 16 kg/m<sup>3</sup>.  
 30

1 **DATA-F-D-2.7 Packaging Material Densities for a Remote-Handled TRU-Waste**  
 2 **Canister Used to Over-Pack Three 55-Gallon Drums**

3 **DATA-F-D-2.7.1 Steel**

4 For the case of three 55-gallon drums overpacked in an RH-TRU waste canister, the total weight  
 5 of steel is a combination of the steel in the RH-TRU waste canister and steel in the three 55-  
 6 gallon drums. The weight of a 55-gallon drum is 27 kg (60 lbs) (NRC 2003) and the weight of  
 7 steel in an RH-TRU waste canister is 386 kg (852 lbs) (DOE 1995). The density of steel for the  
 8 RH-TRU waste canister with three 55-gallon drums in it is calculated as follows:

$$9 \quad \text{Density of Steel} = \frac{(3 \text{ drums} \times 60 \text{ lbs} + 852 \text{ lbs}) / (2.205 \text{ lbs/kg})}{0.89 \text{ m}^3 \text{ per RH-TRU waste canister}} = 526 \text{ kg/m}^3.$$

11 **DATA-F-D-2.7.2 Plastic**

12 The plastic will be contributed entirely by the rigid liners in the three overpacked 55-gallon  
 13 drums. The plastic liners weigh approximately 7.7 kg (17 lbs) each (DOE 1995) and are in the  
 14 total volume of the RH-TRU waste canister. The density of plastic packaging is calculated as  
 15 follows:

$$16 \quad \text{Density of Plastic} = \frac{3 \text{ drums} \times 7.7 \text{ kg of plastic per drum}}{0.89 \text{ m}^3 \text{ per RH-TRU waste canister}} = 26 \text{ kg/m}^3.$$

18 **DATA-F-D-2.7.3 Lead**

19 Since the 55-gallon drums do not contribute any lead, the calculation for this case is the same as  
 20 that of a directly loaded RH-TRU waste canister (464 kg/m<sup>3</sup>), as calculated in Section DATA-F-  
 21 D-2.5).

22 **DATA-F-D-2.8 Packaging Material Densities for Ten 55-Gallon Drums in a Ten-Drum**  
 23 **Overpack**

24 **DATA-F-D-2.8.1 Steel**

25 For the case of ten 55-gallon drums overpacked in a TDOP, the total weight of steel is a  
 26 combination of the steel in the TDOP and the ten 55-gallon drums. The weight of an empty  
 27 TDOP is 771 kg (1,700 lbs) (NRC 2003). The volume of a TDOP is 4.79 m<sup>3</sup>. The weight of a  
 28 55-gallon drum is 60 lbs. The density of steel packaging in the TDOP with 10 drums in it is:

$$29 \quad \text{Density of Steel} = \frac{(10 \text{ drums} \times 60 \text{ lbs} + 1,700 \text{ lbs}) / (2.205 \text{ lbs/kg})}{4.79 \text{ m}^3 \text{ per TDOP}} = 218 \text{ kg/m}^3.$$

31 **DATA-F-D-2.8.2 Plastic**

32 The plastic in the TDOP will be contributed entirely by the rigid liners in the 10-overpacked  
 33 drums. The density of plastic packaging is calculated as follows:

1 Density of Plastic =  $\frac{10 \text{ drums} \times 7.7 \text{ kg of plastic per drum}}{4.79 \text{ m}^3 \text{ per TDOP}}$  = 16 kg/m<sup>3</sup>.  
 2

3 **DATA-F-D-3.0 GENERATOR SITE PACKAGING MATERIAL DENSITIES**

4 Several generator sites originally reported data in a way that did not reflect the volume the waste  
 5 would occupy when disposed in the WIPP. The volume of waste needed for the PA in support of  
 6 the CRA is the volume that will be disposed in the WIPP. Therefore, all data and calculations  
 7 were reviewed and adjusted as necessary to reflect the volume the waste would occupy once  
 8 disposed in the WIPP. Table DATA-F-D-1 lists the large and small quantity TRU waste  
 9 generator sites that required some adjustment of their packaging material, along with the ERMS  
 10 reference number for the associated routine calculation.

11 **Table DATA-F-D-1. TRU Waste Generator Sites and Associated ERMS Numbers for**  
 12 **Routine Calculations Related to Packaging Material Densities**

Generator Site	ERMS # for Routine Calculation
Hanford Richland Operations Office (Hanford RL)	530693
Hanford Office of River Protection (Hanford RP)	530675
Idaho National Engineering and Environmental Laboratory (INEEL)	530666 (IN-BN-510) 530688 (Non-Debris) 530679 (RH/Other)
Los Alamos National Laboratory (LANL)	530717
Argonne National Laboratories East (ANL-E)	530643
Argonne National Laboratories West (ANL-W)	530639

Lawrence Livermore National Laboratory (LLNL)	530662
Paducah Gaseous Diffusion Plant (PGDP)	530670

13 Table DATA-F-D-2 contains a summary of the packaging configurations and packaging material  
 14 densities for sites whose packaging required updating to obtain the volume needed for the PA in  
 15 support of the CRA. The processes used to obtain these results are described in Sections DATA-  
 16 F-D-3.1 through DATA-F-D-3.11.

1

LLNL	Repackaging large boxes into SWBs or SLBs.	154	0	0
PGDP	Four 55-gallon drums overpacked in an SWB.	212	17.5	0

<sup>1</sup> See Appendix DATA, Attachment F, page v for site acronym definitions.

<sup>2</sup> This is the packaging configuration determined to be acceptable for shipment to and disposal in the WIPP.

<sup>3</sup> These are the new packaging material densities as calculated, in the routine calculations listed in Table DATA-F-D-1.

1

**2 DATA-F-D-3.1 Hanford Richland Packaging Material Densities**

3 Hanford Richland (RL) originally reported 229 contact-handled (CH)-TRU and 119 RH-TRU  
4 waste streams (ERMS #526736). The site had misinterpreted the “R” in one of their database  
5 fields to mean RH-TRU waste when it actually indicated that the waste was “radioactive.” The  
6 result was that Hanford RL actually had 306 CH-TRU waste streams and 42 RH-TRU waste  
7 streams. Therefore, 77 waste streams required a change in the shipping container from an RH-  
8 TRU waste canister to other packaging acceptable for CH-TRU waste shipment and disposal. As  
9 a result, the packaging material densities for the 77 CH-TRU waste streams were recalculated.  
10 Hanford RL submitted updated information indicating the appropriate shipping containers  
11 (ERMS #530628). The new shipping containers were directly loaded 55-gallon drums and  
12 SWBs. The packaging material densities for the 55-gallon drums and SWBs were determined as  
13 shown in Sections DATA-F-D-2.1 and DATA-F-D-2.4, respectively.

14 The updated volume of waste that will be received at the WIPP, the corresponding waste and  
15 packaging material densities, and the radionuclide concentrations were determined and  
16 documented in Calculation of Waste Stream Volumes, Waste Material Densities, Container  
17 Material Densities, and Radionuclide Concentrations for Corrected Hanford (RL) Waste Streams  
18 for the Compliance Recertification Application (ERMS #530693). The packaging material  
19 densities for these 77 waste streams were adjusted according to the results of this calculation.

**20 DATA-F-D-3.2 Hanford River Protection Packaging Material Densities**

21 Hanford River Protection (RP) originally reported data for two of its waste streams in a way that  
22 did not reflect the volume that the waste will occupy when disposed in the WIPP (ERMS  
23 #526473). Specifically, Hanford RP intends to ship these waste streams in 55-gallon drums  
24 overpacked in RH-TRU waste canisters. However, the waste volume reported was determined  
25 using the internal volume of the three 55-gallon drums ( $3 \times 0.21 = 0.63 \text{ m}^3$ ) instead of the  
26 volume of the RH-TRU waste canister ( $0.89 \text{ m}^3$ ), which is representative of the volume of waste  
27 to be emplaced in WIPP. The waste stream volume and the packaging material densities were  
28 recalculated based on the volume of the RH-TRU waste canister ( $0.89 \text{ m}^3$ ), as shown in Section  
29 DATA-F-D-2.7 for three 55-gallon drums overpacked in an RH-TRU waste canister.

30 The updated volume of waste that will be received at the WIPP, the corresponding waste and  
31 packaging material densities, and the radionuclide concentrations were determined and  
32 documented in Calculation of Waste Stream Volumes, Waste and Container Material Densities,  
33 and Radionuclide Concentrations for RP RH TRU Waste Streams RP-W013 and RP-W016 for  
34 the Compliance Recertification Application (ERMS #530675). The packaging material densities  
35 for these two RH-TRU waste streams were adjusted according to the results of this calculation.

**36 DATA-F-D.3.3 Idaho National Engineering and Environmental Laboratory Packaging  
37 Material Densities**

38 Idaho National Engineering and Environmental Laboratory (INEEL) originally reported data for  
39 several of its waste streams in a way that did not reflect the volume that the waste will occupy

1 when disposed in the WIPP. Three routine calculations were developed for the INEEL waste  
2 streams. The first focuses on the super-compacted waste stream originating from the Advanced  
3 Mixed Waste Treatment Facility (AMWTF). The second routine calculation discusses the non-  
4 debris waste streams from the AMWTF. The third routine calculation covers 13 other INEEL  
5 waste streams for which the packaging configurations did not reflect the volume that the waste  
6 will occupy in the WIPP. These three routine calculations consistently estimate the packaging  
7 material densities for each of the disposal container types and are referenced and summarized  
8 below.

### 9 ***DATA-F-D-3.3.1 Super-Compacted Debris Waste Stream IN-BN-510***

10 The INEEL reported one debris waste stream originating from the AMWTF that would be super-  
11 compacted (ERMS #528171). This data submission included the total volume of the waste  
12 stream (11,635 m<sup>3</sup>), the intended shipping container type (100-gallon drums), and the packaging  
13 material densities (steel 308.9 kg/m<sup>3</sup>, no plastic or lead). However, updated information (ERMS  
14 #530423) revealed that the waste would be packaged in the drums so that the drums were  
15 approximately 60 percent full. This resulted in a change to the number of 100-gallon drums and  
16 hence the waste stream volume to be received at the WIPP (19,875 m<sup>3</sup>). Subsequently, the  
17 packaging material density for steel was calculated based on the new waste stream volume,  
18 yielding a new value of 119.7 kg/m<sup>3</sup>.

19 The updated volume of waste that will be received at the WIPP, the corresponding waste and  
20 packaging material densities, and the radionuclide concentrations were determined and  
21 documented in Calculation of Waste Stream Volume, Waste and Container Material Densities,  
22 and Radionuclide Concentrations for INEEL Waste Stream IN-BN-510 for the Compliance  
23 Recertification Application (ERMS #530666). The packaging material densities for this waste  
24 stream were adjusted according to the results of this calculation.

### 25 ***DATA-F-D-3.3.2 Advanced Mixed Waste Treatment Facility Non-Debris Waste Streams***

26 The INEEL reported 38 non-debris waste streams originating from the AMWTF (ERMS  
27 #528171). However, updated information from INEEL (ERMS #530423) revealed changes in  
28 the shipping container type and a resulting change in the volume of waste to be received at the  
29 WIPP. Specifically, INEEL originally reported only TDOPs as shipping containers, but its  
30 updated information identified both TDOPs and SWBs as shipping containers for each waste  
31 stream. There were therefore two cases considered regarding packaging material densities: Ten  
32 55-gallon drums overpacked in a TDOP, and four 55-gallon drums overpacked in an SWB.

33 The steel packaging material densities reported in the original submittal from INEEL were  
34 calculated based on the original densities given by the site that were based on the total waste  
35 stream volumes, and the total volume of the TDOP (4.79 m<sup>3</sup>). However, INEEL updated its  
36 information indicating that each waste stream would be packaged in 55-gallon drums that would  
37 then be overpacked in SWBs and TDOPs. Therefore, the packaging material densities were  
38 recalculated based on the number of TDOPs and SWBs for each waste stream as given by  
39 INEEL in its updated information. Further, the original calculations were done using the actual  
40 volume of ten 55-gallon drums of waste (2.08 m<sup>3</sup>) instead of the volume that the waste actually  
41 occupies (4.79 m<sup>3</sup>). As a result, the mass of steel did not vary for the TDOP, but the volume

1 increased, causing the steel packaging material density to decrease from 480 kg/m<sup>3</sup> to 208 kg/m<sup>3</sup>.  
 2 The plastic packaging material density originally reported by INEEL varied by waste stream.  
 3 However, the mass of plastic did not change and, for most of the waste streams, the plastic  
 4 packaging material density decreased from 55 kg/m<sup>3</sup> to 24 kg/m<sup>3</sup>.

5 For the SWBs the steel and plastic packaging material densities were calculated in the routine  
 6 calculation based on the volume of the SWB (1.89 m<sup>3</sup>), as shown in Section DATA-F-D-2.6, for  
 7 four 55-gallon drums overpacked in an SWB.

8 The updated volume of waste that will be received at the WIPP, the corresponding waste and  
 9 packaging material densities, and the radionuclide concentrations were determined and  
 10 documented in Calculation of Waste Stream Volumes, Waste and Container Material Densities,  
 11 and Radionuclide Concentrations for Non-Debris AMWTF Waste Streams at INEEL for the  
 12 Compliance Recertification Application (ERMS #530688). The packaging material densities for  
 13 these 38 waste streams were adjusted according to the results of this calculation.

14 ***DATA-F-D-3.3.3 Idaho National Engineering and Environmental Laboratory Waste***  
 15 ***Streams Requiring Overpacking***

16 The INEEL reported data for its waste streams based, for the most part, on the current packaging  
 17 configuration of the waste. For 13 of its waste streams, the current packaging configuration did  
 18 not match the intended shipping configuration. For example, 55-gallon drums were reported, but  
 19 INEEL actually intends to ship these drums inside SWBs.

20 The updated volume of waste that will be received at the WIPP, the corresponding waste and  
 21 packaging material densities, and the radionuclide concentrations were determined and  
 22 documented in Calculation of Final Form Values For IN-AE-AGHC-01, IN-INTEC-SFS-01, IN-  
 23 NRF-153, IN-W219.914, IN-W322.851, IN-W323.562, IN-W337.957, IN-W341.954, IN-  
 24 W342.652, IN-W358.854, IN-W358.949, IN-W372.832, and IN-W372.918 for the Compliance  
 25 Recertification Application (ERMS #530679). The packaging material densities for these 13  
 26 waste streams were adjusted according to the results of this calculation. The calculations needed  
 27 for the packaging material densities for these INEEL waste streams in the routine calculation are  
 28 summarized below.

29 ***DATA-F-D-3.3.3.1 Overpacking Three 55-Gallon Drums into a Remote-Handled-Transuranic***  
 30 ***Waste Canister***

31 The packaging configuration for two of the 13 INEEL waste streams was determined to be three  
 32 55-gallon drums overpacked in an RH-TRU waste canister. Therefore, the steel and plastic  
 33 packaging material densities were determined in the routine calculation based on the volume of  
 34 the RH-TRU waste canister (0.89 m<sup>3</sup>), as shown in Section DATA-F-D-2.7 for three 55-gallon  
 35 drums overpacked in an RH-TRU waste canister. The packaging material densities were  
 36 calculated to be steel 526 kg/m<sup>3</sup>, plastic 26 kg/m<sup>3</sup>, and lead 464 kg/m<sup>3</sup>.

1 DATA-F-D-3.3.3.2 Overpacking Three 30-Gallon Drums into a Remote-Handled-Transuranic  
2 Waste Canister

3 The packaging configuration for three of the 13 INEEL waste streams was determined to be  
4 three 30-gallon drums overpacked in an RH-TRU waste canister. Therefore, the steel and plastic  
5 packaging material densities were determined in the routine calculation based on the volume of  
6 the RH-TRU waste canister ( $0.89 \text{ m}^3$ ). The calculation is similar to that shown in Section  
7 DATA-F-D-2.7 for three 55-gallon drums overpacked in an RH-TRU waste canister, except that  
8 the total weight of steel for this case was determined based on the steel packaging material  
9 density given by the site for the 30-gallon drum ( $168 \text{ kg/m}^3$ ). The resulting steel packaging  
10 material density was  $498 \text{ kg/m}^3$ . Since the only source of lead is the RH-TRU waste canister, the  
11 lead packaging material density is  $464 \text{ kg/m}^3$ , as calculated in Section DATA-F-D-2.7. No  
12 plastic packaging was reported by the site for the 30-gallon drums.

13 DATA-F-D-3.3.3.3 Overpacking Four 55-Gallon Drums into a Standard Waste Box

14 The packaging configuration of the 13 INEEL waste streams was determined to be four 55-  
15 gallon drums overpacked in an SWB. Therefore, the steel and plastic packaging material  
16 densities were calculated in the routine calculation, as shown in Section DATA-F-D-2.6, for four  
17 55-gallon drums overpacked in an SWB.

18 **DATA-F-D-3.4 Los Alamos National Laboratory Packaging Material Densities**

19 Los Alamos National Laboratory (LANL) reported data for its waste streams based on the  
20 current packaging configuration of the waste. Of the 63 waste streams reported by LANL, 33  
21 were reported with unacceptable containers for shipment to WIPP in the TRUPACT-II (NRC  
22 2003). Of the 33 waste streams, 27 waste streams were reported with containers that require  
23 overpacking prior to shipment, and six waste streams have container types that will require  
24 repackaging prior to shipment.

25 The updated volume of waste that will be received at the WIPP, the corresponding waste and  
26 packaging material densities, and the radionuclide concentrations were determined and  
27 documented in Calculation of Waste Stream Volumes, Waste Material Densities, Container  
28 Material Densities, and Radionuclide Concentrations for LANL Waste Streams for the  
29 Compliance Recertification Application (ERMS #530717). The packaging material densities for  
30 these 33 waste streams were adjusted according to the results of this calculation. The  
31 calculations needed for the packaging material densities of the LANL waste streams in the  
32 routine calculation are summarized below.

33 **DATA-F-D-3.4.1 Overpacking 15-Gallon Drums into a 55-Gallon Drum**

34 Los Alamos National Laboratory reported 15-gallon drums for one waste stream. In this  
35 calculation, it was assumed that three 15-gallon drums would be placed in one 55-gallon drum.  
36 The calculated steel packaging material density for one 55-gallon drum and three 15-gallon  
37 drums was  $262 \text{ kg/m}^3$ . The plastic packaging material density for a 55-gallon drum liner was  
38 calculated as shown in Section DATA-F-D-2.1 for a directly loaded 55-gallon drum ( $37 \text{ kg/m}^3$ ).

1 ***DATA-F-D-3.4.2 Overpacking 30-Gallon Drums into 55-Gallon Drums***

2 Los Alamos National Laboratory reported 30-gallon drums for several waste streams. In this  
 3 calculation, it was assumed that one 30-gallon drum would be placed in one 55-gallon drum.  
 4 The calculated steel packaging material density for one 55-gallon drum and one 30-gallon drum  
 5 was 207 kg/m<sup>3</sup>. The plastic packaging material density for a 55-gallon drum liner was calculated  
 6 as shown in Section DATA-F-D-2.1 for a directly loaded 55-gallon drum (37 kg/m<sup>3</sup>).

7 ***DATA-F-D-3.4.3 Overpacking Small Containers (Including “Other,” “Unknown,” and***  
 8 ***“Cardboard Box” into 55-Gallon Drums***

9 Los Alamos National Laboratory reported other or unknown containers that will fit into 55-  
 10 gallon drums for several waste streams. Because the container volumes of the other/unknown  
 11 containers vary by waste stream and the container materials and dimensions were not provided  
 12 by the site, the packaging materials for a directly loaded 55-gallon drum, as shown in Section  
 13 DATA-F-D-2.1, were used (density of steel = 131 kg/m<sup>3</sup>, and density of plastic = 37 kg/m<sup>3</sup>).

14 ***DATA-F-D-3.4.4 Overpacking Crates, Fiberglass-Reinforced Polyethylene Boxes, or***  
 15 ***Other/Unknown Large Containers into Standard Waste Boxes or Standard***  
 16 ***Large Boxes***

17 Los Alamos National Laboratory reported crates, FRP boxes, and “other” or “unknown”  
 18 containers of various sizes. However, since the only acceptable large shipping containers are the  
 19 SWB and the SLBs,<sup>1</sup> all crates, FRP boxes, and unknown/other containers that will fit into the  
 20 SWBs and SLBs must be overpacked into the SWBs or SLBs.<sup>2</sup>

21 Because the container volumes of the crates, FRP boxes, and other/unknown containers varied  
 22 by waste stream, and the container materials and dimensions were not provided by LANL, the  
 23 packaging material densities for a directly loaded SWB, as shown in Section DATA-F-D-2.4,  
 24 were used in the routine calculation for the SLBs.

25 ***DATA-F-D-3.4.5 Repackaging (Size Reduction) of Crates, Fiberglass-Reinforced***  
 26 ***Polyethylene Boxes, or Other/Unknown Large Containers into Standard***  
 27 ***Waste Boxes***

28 Los Alamos National Laboratory reported large containers (greater than the volume of the SLB)  
 29 for six waste streams. In order for LANL to ship these waste streams to the WIPP, it will have to  
 30 “size-reduce” the waste (including the original waste containers) and directly load the size-

---

<sup>1</sup> Development of the TRUPACT-III, which will allow shipment of the SLBs to WIPP for disposal, is under way. According to DOE guidance (DOE 2003), inventory estimates for the CRA allow the use of the SLB as a payload container for WIPP.

<sup>2</sup> The SLBs are sometimes generically referred to as “5 × 5 × 8 boxes,” where the units of measure are in feet. The SLBs are in the preliminary design stage and only preliminary specifications are available. Therefore, the volume of the 5 × 5 × 8-foot box, 5.66 m<sup>3</sup>, was used in the routine calculation as a close approximation of the internal volume of the SLB.

1 reduced waste and containers into SWBs.<sup>3</sup> Therefore, the steel and plastic packaging densities  
2 associated with the SWBs, as described in Section DATA-F-D-2.4, were used.

### 3 **DATA-F-D-3.5 Argonne National Laboratory-East Packaging Material Densities**

4 Argonne National Laboratory-East (ANL-E) reported a packaging configuration for waste  
5 stream AE-T009 as three 30-gallon drums overpacked in an RH-TRU waste canister (ERMS  
6 #526109). The volume of RH-TRU waste originally reported by ANL-E is the waste volume  
7 associated with the 30-gallon drums that will be loaded into the RH-TRU waste canister, which  
8 does not reflect the volume of waste that will be disposed in the WIPP. Therefore, the steel,  
9 plastic, and lead packaging material densities were recalculated based on the volume of the RH-  
10 TRU waste canister (0.89 m<sup>3</sup>). The calculation is similar to that shown in Section DATA-F-D-  
11 2.7 for three 55-gallon drums overpacked in an RH-TRU waste canister, except that the total  
12 weight of steel for this case was determined based on the steel packaging material density given  
13 by the site for the 30-gallon drums (124.4 kg/m<sup>3</sup>). The resulting steel packaging material density  
14 was 481 kg/m<sup>3</sup>. Since the lead is contributed entirely by the RH-TRU waste canister, the lead  
15 packaging material density is 464 kg/m<sup>3</sup>, as calculated in Section DATA-F-D-2.7. The density  
16 of plastic was also given by the site (39.9 kg/m<sup>3</sup>), and this was used to determine the plastic  
17 packaging density (15 kg/m<sup>3</sup>).

18 The updated volume of waste that will be received at the WIPP, the corresponding waste and  
19 packaging material densities, and the radionuclide concentrations were determined and  
20 documented in Calculation of Waste Stream Volumes, Waste and Container Material Densities,  
21 and Radionuclide Concentrations for AE-T009 at ANL-E for the Compliance Recertification  
22 Application (ERMS #530643). The packaging material densities for this RH-TRU waste stream  
23 were adjusted according to the results of this calculation.

### 24 **DATA-F-D-3.6 Argonne National Laboratory-West Packaging Material Densities**

25 Argonne National Laboratory-West (ANL-W) reported a packaging configuration for eight  
26 waste streams as three 45-gallon drums overpacked in an RH-TRU-waste canister (ERMS  
27 #526407). The volume of RH-TRU waste originally reported by ANL-W is the waste volume  
28 associated with the 45-gallon drums that will be loaded into the RH-TRU waste canister, which  
29 does not reflect the volume of waste that will be disposed in the WIPP. Therefore, the steel,  
30 plastic, and lead packaging material densities were recalculated based on the volume of the RH-  
31 TRU waste canister (0.89 m<sup>3</sup>). The calculation is similar to that shown in Section DATA-F-D-  
32 2.7 for three 55-gallon drums overpacked in an RH-TRU waste canister, except that the total  
33 weight of steel for this case was determined assuming the 45-gallon drums weighed 23 kg (51  
34 lbs) each and that the mass of steel in an RH-TRU waste canister was 386 kg (851 lbs). The  
35 resulting steel packaging material density was 511 kg/m<sup>3</sup>. Since the only source of lead is the  
36 RH-TRU waste canister, the lead packaging material density is 464 kg/m<sup>3</sup>, as calculated in  
37 Section DATA-F-D-2.7. The density of plastic (21 kg/m<sup>3</sup>) was determined by first calculating  
38 the mass of the plastic liner for a 45-gallon drum (6.3 kg).

---

<sup>3</sup> Repackaging into the SLBs is not considered in the routine calculation because the SWBs are currently approved and available for this use and the SLBs are not.

1 The updated volume of waste that will be received at the WIPP, the corresponding waste and  
2 packaging material densities, and the radionuclide concentrations were determined and  
3 documented in Calculation of Waste Stream Volumes, Waste and Container Material Densities,  
4 and Radionuclide Concentrations for RH Waste Streams at ANL-W for the Compliance  
5 Recertification Application, (ERMS #530639). The packaging material densities for these RH  
6 waste streams were adjusted according to the results of this calculation.

### 7 **DATA-F-D-3.7 Battelle Columbus Laboratories Packaging Material Densities**

8 Battelle Columbus Laboratories (BCL) reported data for 12 RH-TRU waste streams.  
9 Specifically, BCL reported that the RH-TRU waste would be packaged in 55-gallon drums, and  
10 that those drums would be configured in a five-drum pallet inside the ChemNuclear Systems  
11 (CNS) 10-160B shipping container for shipment to WIPP (ERMS # 526424). The volumes of  
12 RH-TRU waste originally reported are those associated with the 55-gallon drums that will be  
13 loaded into the CNS 10-160B package. Ultimately, the 55-gallon drums will be taken to the  
14 WIPP RH-waste hot cell and placed in an RH-TRU waste canister for disposal. Therefore, the  
15 steel, plastic, and lead packaging material densities were recalculated based on the materials and  
16 volume of the RH-TRU waste canister ( $0.89 \text{ m}^3$ ). The calculation is similar to that shown in  
17 Section DATA-F-D-2.7 for three 55-gallon drums overpacked in an RH-TRU waste canister,  
18 except that the total weight of steel for this case was determined based on the steel packaging  
19 material density given by the site for the 55-gallon drums ( $481 \text{ kg/m}^3$ ). The resulting steel  
20 packaging material density for the RH-TRU waste canister with three 55-gallon drums in it was  
21  $770 \text{ kg/m}^3$ . Since the lead is contributed entirely by the RH-TRU waste canister, the lead  
22 packaging material density is  $464 \text{ kg/m}^3$ , as calculated in Section DATA-F-D-2.7. The density  
23 of plastic was also given by the site ( $24 \text{ kg/m}^3$ ), and this was used to determine the plastic  
24 packaging density ( $17 \text{ kg/m}^3$ ) based on the updated volume.

25 The updated volume of waste that will be received at the WIPP, the corresponding waste and  
26 packaging material densities, and the radionuclide concentrations were determined and  
27 documented in Calculation of Waste Stream Volumes, Waste and Container Material Densities,  
28 and Radionuclide Concentrations for RH Waste Streams at BCL for the Compliance  
29 Recertification Application (ERMS #530634). The packaging material densities for these RH-  
30 TRU waste streams were adjusted according to the results of this calculation.

### 31 **DATA-F-D-3.8 Energy Technology Engineering Center Packaging Material Densities**

32 Energy Technology Engineering Center (ETEC) reported data for two RH-TRU waste streams,  
33 and that the RH-TRU waste will first be packaged in 55-gallon drums, then placed in RH-TRU  
34 waste canisters for shipment to WIPP (ERMS #526444). The volumes of RH-TRU waste in the  
35 ETEC waste streams originally reported are the waste volumes associated with the 55-gallon  
36 drums loaded into the RH-TRU waste canister. Therefore, the steel, plastic, and lead packaging  
37 material densities were recalculated based on the materials and volume of the RH-TRU waste  
38 canister ( $0.89 \text{ m}^3$ ). The calculation is similar to that shown in Section DATA-F-D-2.7 for three  
39 55-gallon drums overpacked in an RH-TRU waste canister. The resulting steel packaging  
40 material density for the RH-TRU waste canister with three 55-gallon drums in it was  $525 \text{ kg/m}^3$ .  
41 Since the lead is contributed entirely by the RH-TRU waste canister, the lead packaging material  
42 density is  $464 \text{ kg/m}^3$ , as calculated in Section DATA-F-D-2.7. The density of plastic was also

1 given by the site ( $37 \text{ kg/m}^3$ ), and this was used to determine the plastic packaging density (26  
2  $\text{kg/m}^3$ ).

3 The updated volume of waste that will be received at the WIPP, the corresponding waste and  
4 packaging material densities, and the radionuclide concentrations were determined and  
5 documented in Calculation of Waste Stream Volumes, Waste and Container Material Densities,  
6 and Radionuclide Concentrations for ET-R1-DLR and ET-R2-D107 at ETEC for the Compliance  
7 Recertification Application (ERMS #530658). The packaging material densities for these RH-  
8 TRU waste streams were adjusted according to the results of this calculation.

### 9 **DATA-F-D.3.9 Knolls Atomic Power Laboratory Packaging Material Densities**

10 Knolls Atomic Power Laboratory (KAPL) (Schenectady, NY) reported data for two RH-TRU  
11 waste streams, and that the RH-TRU waste will be packaged in 55-gallon drums and then placed  
12 in RH-TRU waste canisters for shipment to WIPP (ERMS #526087). The volumes of RH-TRU  
13 waste in the KAPL waste streams originally reported are the waste volumes associated with the  
14 55-gallon drums that will be loaded into the RH-TRU waste canister. Therefore, the steel,  
15 plastic, and lead packaging material densities were recalculated based on the materials and  
16 volume of the RH-TRU waste canister ( $0.89 \text{ m}^3$ ). The calculation is similar to that shown in  
17 Section DATA-F-D-2.7 for three 55-gallon drums overpacked in an RH-TRU waste canister,  
18 except that the total weight of steel for this case was determined based on the steel packaging  
19 material density given by the site for the 55-gallon drums ( $131 \text{ kg/m}^3$ ). The resulting steel  
20 packaging material density for the RH-TRU waste canister with three 55-gallon drums in it was  
21  $526 \text{ kg/m}^3$ . Since the lead is contributed entirely by the RH-TRU canister, the lead packaging  
22 material density is  $464 \text{ kg/m}^3$ , as calculated in Section DATA-F-D-2.7. The density of plastic  
23 was also given by the site ( $37 \text{ kg/m}^3$ ) and used to determine the plastic packaging density ( $26$   
24  $\text{kg/m}^3$ ).

25 The updated volume of waste that will be received at the WIPP, the corresponding waste and  
26 packaging material densities, and the radionuclide concentrations were determined and  
27 documented in Calculation of Waste Stream Volumes, Waste and Container Material Densities,  
28 and Radionuclide Concentrations for KA-T001 and KA-W016 at KAPL for the Compliance  
29 Recertification Application (ERMS #530648). The packaging material densities for these RH-  
30 TRU waste streams were adjusted according to the results of this calculation.

### 31 **DATA-F-D-3.10 Lawrence Livermore National Laboratory Packaging Material Densities**

32 Lawrence Livermore National Laboratory (LLNL) reported data for three CH-TRU waste  
33 streams. These three waste streams are currently stored in miscellaneous-sized boxes that cannot  
34 be used as payload containers for shipment to and disposal in WIPP (ERMS #526536). The  
35 volumes reported by LLNL are the waste volumes associated with the current storage  
36 configuration in various sized boxes. Therefore, acceptable shipping containers and the updated  
37 packaging material densities were needed. Each of the three waste streams will be shipped and  
38 disposed in 55-gallon drums, SWBs, and SLBs. The packaging materials reported for the 55-  
39 gallon drums did not change, since the drums did not require repackaging or overpacking.  
40 However, the miscellaneous sized boxes required repackaging. The steel originally reported as  
41 packaging material for the waste becomes waste material after repackaging and was added to the

1 Iron-Base Metal/Alloys category. The steel packaging associated with shipping containers was  
2 simply the steel packaging for the shipping container (either a 55-gallon drum, SWB, or SLB).  
3 The SLB is a new box that will likely be used for repackaging LLNL waste. Because the SLB is  
4 still being designed (see Section DATA-F-D-3.4.5) and it has no set specifications, the  
5 packaging material densities for a directly loaded SWB, as shown in Section DATA-F-D-2.4,  
6 were used in the routine calculation for the SLBs. Therefore, the steel packaging material density  
7 was  $154 \text{ kg/m}^3$  for both SWBs and SLBs. The calculation assumed no plastic packaging for the  
8 SWBs and SLBs.

9 The updated volume of waste that will be received at the WIPP, the corresponding waste and  
10 packaging material densities, and the radionuclide concentrations were determined and  
11 documented in Calculation of Waste Stream Volumes, Waste and Container Material Densities,  
12 and Radionuclide Concentrations for LL-T002, LL-T005, and LL-T034 for the Compliance  
13 Recertification Application (ERMS #530662). The packaging material densities for these RH-  
14 TRU waste streams were adjusted according to the results of this calculation.

### 15 **DATA-F-D-3.11 Paducah Gaseous Diffusion Plant Packaging Material Densities**

16 Paducah Gaseous Diffusion Plant (PGDP) reported data for one CH-TRU waste stream, which  
17 will be packaged in 55-gallon drums and then be placed in SWBs for shipment to WIPP (ERMS  
18 #526074). The volume of the waste in this waste stream is the waste volume associated with the  
19 55-gallon drums that will be loaded into the SWB, which does not reflect the volume of waste  
20 that will be disposed in the WIPP. Therefore, the volume of waste was recalculated in the  
21 routine calculation identified below. However, the steel and plastic packaging material densities  
22 reported by the site did correspond to the packaging configuration for four 55-gallon drums  
23 overpacked in an SWB (steel and plastic packaging material densities were reported as  $212$   
24  $\text{kg/m}^3$ , and  $17.5 \text{ kg/m}^3$ , respectively), and were therefore not recalculated in the routine  
25 calculation.

26 The updated volume of waste that will be received at the WIPP, the corresponding waste and  
27 packaging material densities, and the radionuclide concentrations were determined and  
28 documented in Calculation of Waste Stream Volumes, Waste and Container Material Densities,  
29 and Radionuclide Concentrations for PA-A015 at PGDP for the Compliance Recertification  
30 Application (ERMS #530670). The packaging material densities for these RH-waste streams  
31 were adjusted according to the results of this calculation.
