

ANNEX J to ATTACHMENT F
WASTE STREAM PROFILES – WIPP

NOTE: The TRU Waste Baseline Inventory Waste Profile forms only reflect the data as reported by the TRU Waste Sites. During the process of generating the TRU Waste Baseline Inventory Report for the CRA, priority was given to developing data on those parameters considered important to performance assessment (PA). SNL will evaluate whether any of the individual or cumulative inconsistencies identified have an impact on PA.

1 The following waste stream profiles contain information on waste streams compliant with the
 2 Contact-Handled Transuranic Waste Acceptance Criteria for the Waste Isolation Pilot Plant (CH-
 3 WAC; DOE 2002) as of the inventory date, September 30, 2002. The TRU waste sites that have
 4 reported WIPP waste streams are:

5	Argonne National Laboratory – East	AE
6	Argonne National Laboratory – West	AW
7	Battelle Columbus Laboratory	BC
8	Bettis Atomic Power Laboratory	BT
9	Energy Technology Engineering Center	ET
10	Idaho National Engineering and Environmental Laboratory	IN
11	Knolls Atomic Power Laboratory – Schenectady	KA
12	Knolls Atomic Power Laboratory – Nuclear Fuels Service	KN
13	Los Alamos National Laboratory	LA
14	Lawrence Livermore National Laboratory	LL
15	U. S. Army Material Command	MC
16	University of Missouri Research Reactor	MU
17	Nevada Test Site	NT
18	Oak Ridge National Laboratory	OR
19	Paducah Gaseous Diffusion Plant	PA
20	Rocky Flats Environmental Technology Site	RF
21	Hanford (Richland)	RL
22	Hanford (River Protection)	RP
23	Sandia National Laboratories (Albuquerque)	SA
24	Savannah River Site	SR

25 Editorial Note: The date, “Stored End of CY 2001” under the waste volume detail area of the
 26 waste profile forms should be “Stored End of FY 2002,” indicating the end of the fiscal year
 27 (September 30, 2002) and not the end of calendar year 2001.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	Paint scraping debris from analytical lab hot cell refurbishment.
Waste Stream Source Description	This waste stream was generated at Analytical Lab Hot Cell (ALHC) Upgrade, Bldg 752: Analytical Analysis for ANL-W Research and Development work and Environmental Compliance.. The generating process is: Debris was generated during decontamination of the ALHC to upgrade the facility to support the Fuel Cycle Facility (FCF).
Current Container Comments	N/A
EPA Comments	N/A
Management Comments	This is a TRU waste packaged to meet the WIPP WAC. Particulate materials were solidified for immobilization.
Acceptance Comments	This container requires repackaging to meet WIPP-WAC requirements.
Final Form Comments	N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is typically lead lined gloves removed from casting laboratory glove box.

Waste Stream Source Description This waste stream was generated at Lab and Office Building (752) Engineering Fuels Laboratory (EFL)(B147): The EFL houses an experimental fuels casting lab, and areas for small scale testing of experimental processes related to nuclear fuels fabrication.. The generating process is: The EFL houses a glove box that fully contains a small scale nuclear fuel casting process. Because radioactive materials are handled and processed in the glove box, lead gloves are utilized to provide radiation protection.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	Transuranic waste generated from plutonium casting laboratory (PCL) and Analytical laboratory (AL) Hot cell operations. This waste is typically packaged in 55-gallon drums.
Waste Stream Source Description	This waste stream was generated at ANL-752 A-101 and B-147: Building 752 is called the Lab and Office building. It contains offices, cafeteria, and laboratory areas.. The generating process is: The AL Hot Cell is a shielded enclosure used to handle and perform analytical measurements on irradiated fuel and hardware from HFEF. The plutonium casting laboratory (PCL) is used to run experiments for various waste forms relative to ANL-W operations.

Waste Stream Description This waste stream consists of chloride salts containing residual amounts of cadmium and barium. This waste stream will be generated from the Fuel Conditioning Facility operations as a result of decommissioning the electrorefining equipment. The cadmium pool will be pumped out of the MK-IV electrorefiner using the bulk fluid handling system. It will be treated with the most economical and technically sound available process for treating hazardous metals. The two technologies currently being considered are amalgamation and encapsulation. Amalgamation involves mixing the cadmium with another metal. Encapsulation involves covering the solid cadmium with a layer of plastic. Research and development on one or both of these processes will be done during the inventory reduction phase of spent fuel treatment. If other more promising technologies are proposed in the near future, they will also be considered. The final destination for this waste should be WIPP if the RH canister container can meet the RH radiation limitations of <100 R/hr at contact.

Waste Stream Source Description This waste stream was generated at ANL-765, Fuel Cycle Facility (FCF): Nuclear fuel pyroprocessing operations in support of the Fuel Cycle Facility (FCF) operation.. The generating process is: Spent salt compound (chlorides of Li, Na, Ba, and Cd) from the electrorefiner station in the IFR fuel cycle.

Current Container Comments N/A

EPA Comments Barium and possibly cadmium will contaminate this waste. Concentrations will not be known until the waste is generated.

Management Comments Remote Handled

Acceptance Comments N/A

Waste Stream Description This waste stream consisted of metallic cadmium, salts, and associated cleanup materials (paper towels and cloth rags). The waste is contaminated with activation and fission products as well as with plutonium. This waste stream is generated for Fuel Conditioning Facility Demonstration support experiments; the analysis of fuels in the hot cells.

Previous waste is stored in the Radioactive Scrap and Waste Facility in two liners. Future waste generation will be small because evaporation as part of the process will be done in the hot cell to minimize the volume.

Waste Stream Source Description This waste stream was generated at ANL-785, Hot Fuel Examination Facility (HFEF): Examinations conducted in the HFEF provide data that are essential for detmining the performance of fuels and materials irradiated in the EBR-II Reactor.. The generating process is: This waste stream is generated from Fuel Cycle Facility demonstration support experiments. Small scale test of equipment to be used in the FCF electrorefiner generated the waste.

Current Container Comments N/A

EPA Comments The waste is generated from analytical analysis.

(Continued)**

Isotope	Typical Concentration (Ci/m3)
Y-90	8.63E-01
Zr-95	2.12E-04

Waste Stream Description This waste stream consists of metal or wood framed filters. Filters are 2'x2'x0.5'. The filters have screen mesh covering high efficiency filtering media. The concentration of radioisotopes and RCRA metals varies in each filter. These filters were generated from the decontamination of the analytical hot cells in 1993 and 1994.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The filters consist of two types. One is a depth filter made entirely of polypropylene. The other is a pleated filter made up of a glass fiber filter media with polyester support. This media is housed in a polypropylene cage with silicone O-rings. The filters are used primarily for the removal of cadmium. However, they also remove uranium and plutonium.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The crucible waste stream in the Fuel Conditioning Facility (FCF) has been characterized as TRU waste. Presently, three 45 gallon RH-TRU containers are filled with crushed crucible material, and are awaiting shipment to the radioactive scrap and waste facility (RSWF). Before crushing, crucibles are cleaned below their clean tare weight. Based on samples taken on crushed crucible material, there are only a few tenths of grams of fissile material (u-235 or Pu-239 present per crucible disposed).

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description JN-4 D&D Debris Waste consists of heterogeneous debris waste generated by the activities conducted in Building JN-4. The waste includes paper, plastic, rubber, paint chips, crushed metal cans, prefilters, glass, concrete, grout, lead shot, and miscellaneous laboratory equipment

Waste Stream Source Description N/A

Current Container Comments These bins may be repackaged into drums.

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments Plan to ship to HUB for characterization and certification. TB @ LANL assumed M-111 bins repackaged into SWBs since volumes are the same. This allows us to capture the volume for PA puposes. Understand this is not a commitment by BCL.

Waste Stream Description Hazardous organic debris consists of the materials generated during repackaging of the waste materials generated from research and development activities conducted in Building JN-1. This waste consists primarily of iron based metals, paper, plastic, cloth, aluminum, cellulose, rubber, and lead items (bricks, shot, apron, and gloves).

Waste Stream Source Description N/A

Current Container Comments UN1A2 55 gal steel drums (outer dia. = 24 in, outer ht = 35 inches, 22.7 kg tare wt, with inner 110 mil plastic or 0.105 inch thick steel liner). Each drum and steel liner equipped with a Nucfil-013 filter installed in accordance with WA-OP-006.

Waste Stream Description Pool Water Filter Resin consists of ion-exchange resin (nuclear grade), which was used for deionizing the Transfer/Storage Pool water. The CM-2 Regenerated Mixed Bed Resin used was contained in muslin bags (cotton bags). The matrix will also include Floor Dry (diatomaceous earth) used as an absorbent during the original packaging of this waste and 10 lbs. of absorbent (50:50 Floor Dry and Radsorb) added during repackaging to absorb any water from condensation or dewatering

Waste Stream Source Description N/A

Current Container Comments UN1A2 55 gallon steel drums. Each drum and steel liner shall be equipped with a Nucfil-013 drum filter installed in accordance with WA-OP-06, Procurement and Inspections of Packagings for Hazardous Materials Shipments.

Waste Stream Description Pool Water Prefilters and Debris consists of the cartridge prefilters and debris generated during the change-out of resin used for filtering the Transfer/Storage Pool water. The filter matrix is composed of glass and cellulose fibers combined with melamine resin. The end caps are polypropylene and the filters are placed in the canisters with rubber gaskets (butyl/nitrile). Other debris that may be present from the original packaging may include paper (blotter paper and Floor Dry bags), plastic liners, rubber gaskets, muslin resin bags, rubber gloves, and other miscellaneous plastic, cellulose, and metal materials. The waste matrix will also include Floor Dry and Radsorb added during repackaging to absorb any water from condensation or dewatering.

Waste Stream Description Organic Debris consists of the materials generated during repackaging of the waste materials generated from research and development activities conducted in Building JN-1. This waste consists primarily of rubber debris material including polyethylene, polyvinyl chloride, nylon, Styrofoam, Tygon, plexiglass, and neoprene. Wood debris with no signs of hazardous waste contamination may also be included. Waste items may include non-deteriorated sheeting, hose/tubing, respirators, boots, rain suits, o-rings, electrical cords, safety glasses, plexiglass panels, plywood, and pallets. The waste matrix will also include Floor Dry and Radsorb added during repackaging to absorb any water from condensation or dewatering

Waste Stream Description Inorganic Debris consists of glass and metal debris generated during repackaging of the waste materials generated from research and development activities conducted in Building JN-1. Glass debris includes laboratory glassware, windows, and various glass apparatus. Metal debris may include deteriorated berry cans, cable wire, plachets, sign, valves, piping, strapping, tools, foil, sheeting, fixtures, equipment, hardware, fuel rod cladding, and Metmounts (sectioned metal material embedded in a plastic matrix). Metals of construction include stainless steel, aluminum, iron, copper, beryllium, and zirconium alloy (Zr-2, Zr-4). The waste matrix will also include Floor Dry and Radsorb added during repackaging to absorb any water from condensation or dewatering.

Waste Stream Description Tri-Nuc Filters consists of filter cartridges used in the underwater vacuum system for cleaning the surfaces and filtering the water of the Transfer/Storage Pool. The cartridges are 30" long and 6" in diameter and consist of media enclosed within a stainless steel screen shroud, and aluminum screen reinforced plastisol end caps. The filter media is composed of polypropylene, melt brown reinforced typar, and is available in 0.3, 1, 5, 10, and 20-micron mesh sizes. The waste matrix will also include Floor Dry (diatomaceous earth) and Radsorb (50:50 mix) added to each liner.

Waste Stream Source Description N/A

Current Container Comments UN1A2 55 gallon steel drums. Each drum and steel liner shall be equipped with a Nucfil-013 drum filter installed in accordance with WA-OP-06, Procurement and Inspections of Packagings for Hazardous Materials Shipments.

Waste Stream Description Slugs were produced in Alpha-Gamma Cell 7 by dissolving irradiated (burnup) fuel in an acid solution, which was then diluted several times and mixed with cement and water and allowed to solidify in Styrofoam cups. The slugs will contain only limited amounts of dissolved fuel because of the dilution. The Styrofoam cups will be segregated from the slugs prior to final packaging. The waste matrix will also include Floor Dry and Radsorb added during repackaging to absorb any water from condensation or dewatering

Waste Stream Source Description N/A

Waste Stream Description Laundry sludge consists of a particulate sludge (dirt, debris, and lint) generated when the laundry system still box requires cleaning. The box is heated to boil off the water contained in the particulate material. The resulting sludge is raked into plastic bags containing Radsorb (10%-20% by weight) to absorb any water from condensation or dewatering.

Waste Stream Description Pressure Wash Filters used in the pressure wash water recovery system for filtering wash water transferred for evaporation. Three types of filter/cartridges were used. Cotton media filters consisting of cotton yarn and cotton media wound around a polypropylene core. Resin media type cartridges composed of glass and cellulose fibers combined with melamine resin, and a polypropylene sock filter consisting of polypropylene material supported by a carbon steel ring. Small quantities of sludge collected in the filter housings and settling tank bottoms are included in this waste stream. The waste matrix also includes Radsorb added to each liner.

Waste Stream Source Description N/A

Current Container Comments UN1A2 55 gallon steel drums. Each drum and steel liner shall be equipped with a Nucfil-013 drum filter installed in accordance with WA-OP-006, Procurement and Inspections of Packagings for Hazardous Materials Shipments.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Hydraulic Room Sludge and Debris waste consists of rubble, sludge, and absorbent materials as well as the plastic bags that the waste is in. The hydraulic sludge was absorbed using a greater than 50% No Char and Radsorb polymers. Then the hydraulic sludge was packed in plastic bags with additional No Char, Radsorb, and Floor Dry. Prior to packaging, 10 pounds of absorbent (50:50 Floor Dry and Radsorb) was added to the liner to absorb and water from condensation or dewatering

Waste Stream Source Description N/A

Current Container Comments UN1A2 55 gallon steel drums. Each drum and steel liner shall be equipped with a Nucfil-013 drum filter installed in accordance with WA-OP-006, Procurement and Inspections of Packagings for Hazardous Materials Shipments.

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments May be mixed TRU. Plan to ship steel 55-gallon UN1A2 drums in a 5-drum pallet inside the CNS 10-160B package. Some of this waste will go to WCS for interim storage in the 72B cask.

Waste Stream Description Specimen processing fines, material, and debris.

Waste Stream Source Description Specimen processing fines, material, and debris resulting from operations involving destructive evaluations of irradiated fuel specimens.

Current Container Comments N/A

EPA Comments No regulated contaminants present in waste stream.

Management Comments Bettis is not a long-term storage facility. TRU will be shipped off-site as directed by DOE-HDQ.

Acceptance Comments Data date is 10/7/02

Final Form Comments Original data showed 3 SWBs. Int. volume and # stored changed to more accurately reflect the waste volume of 2 m3 as follows:
2 m3 / .200 m3 / drum = 9.615 drums, rounded to 10 drums.
Tb 3/27/03.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Generated after DOE fuel decladding operations and the clean-up of facilities. Wastes include soft trash (paper, plastic, rubber), vermiculite, solidified oil. Radiological contamination includes TRU (Pu-239/241/238/242,Am-241). The waste was packaged to the 1987 Idaho WIPP criteria in 4 55-gal drums . Waste stream is no longer generated.

Waste Stream Source Description Wastes generated from the clean-up of the Plutonium Facility (Bldg 55) and the Hot Lab (Bldg 20) at the end of operations, but before any D&D activities.

Current Container Comments Waste components and wt%: solidified oil (43-99%), plastic (1-12 %), rubber (0-27%), metal (0-17%).

EPA Comments This waste stream was changed to a mixed waste stream because Freon was used and believed to still be residual. F002 was therefore added and now this is MTRU per Dennis Kneffe on 12/5/02.

Management Comments This W.S. was packaged to Idaho WIPP 1987 criteria. Options for shipping the waste to a suitable site are being considered by DOE.

Acceptance Comments To be shipped to Hanford for Certification.

Final Form Comments This W.S. and others were originally packaged and certified in 1988 to WIPP WAC Rev. 2 by INEEL personnel. This waste stream was shipped to Hanford in December 2002.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Steel and fuel element fines from fuel deblad grinding and cutting operations, plus sand, dirt, grinding materials, and concrete/dust particulate.

Waste Stream Source Description N/A

Current Container Comments Waste previously stored in shielded drums and other containers was consolidated for shipment. Data reflects change indicated in e-mail from D. Kneff to S. Lott dated 12/9/02.

EPA Comments Waste characterization (radiological and chemical) based on process knowledge plus extensive sampling and analysis. Average PCB contaminant 132 ppm.

Management Comments N/A

Acceptance Comments To be shipped to Hanford for certification.

Final Form Comments This waste stream was shipped to Hanford in December 2002.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Generated after DOE fuel decladding operations and the clean-up of facilities. Waste consists of a single 85-lb lead brick with surface transuranic contamination with other lead shielding and other waste (metals, filter, vermiculite and trash). Radiological contamination includes fission (Cs-137, Sr-90) and TRU (Pu-238/242/239/241, Am-241). The waste was packaged to the 1987 Idaho WIPP criteria in a single 55-gal drum. Waste stream is no longer generated.

Waste Stream Source Description Clean-up of Hot Lab at end of operations and before start of D&D activities.

Current Container Comments Waste components and wt% ranges: paper and plastic (4-8%), paper filters (4-8%), steel and aluminum (15-25%), strippable paint (25-35%), lead (30-40%)

EPA Comments The drum contains a lead brick and other lead shielding, all radiologically contaminated, based on process knowledge and CT examination of the drum. There is no CPC Code. Section 3.4.5 should be provided with selection option of: "NONE"

Management Comments This W.S. was packaged to Idaho WIPP 1987 criteria. ETEC has no longer the capability (hot cell or glove box) to package TRU contaminated materials.

Acceptance Comments To be shipped to Hanford for certification.

Final Form Comments This W.S. and others were originally packaged and certified in 1988 to WIPP WAC Rev 2 under INEL overview. This waste stream was shipped to Hanford in December 2002.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream, generated at Argonne National Laboratory-East, contains alpha gamma hot cell waste. Noncombustible and combustible waste are segregated. Combustible wastes include paper, plastic and PVC containers, rubber O-rings and gloves, rags, and Q-tips. Noncombustible wastes include lab equipment, tools, fixtures, glassware, pipe, tubing, fitting, fasteners, firebrick, ferrous and nonferrous metal scraps and parts, and small electric motors. Sodium in the waste is reacted with ethyl alcohol, mixed with pelletized clay, and dried. Nitrates and oxidizing agents are neutralized or reduced, mixed with pelletized clay, and dried to ferrous or ferric salts.

The average organic content is 80 kg/m³. The combustible content of some containers exceeds 25 volume percent, including packaging. Fines are within WIPP-WAC limits. No sludges or free liquids should be present. No explosive or pyrophoric materials should be in this waste. Surface contamination and nuclear criticality meet WIPP-WAC limits. Thermal power does not exceed 10 watts per package. Surface dose rates average 5.3 R/hr and are limited to 30 R/hr. The waste is packaged in 30 gallon drums.

Waste Stream Source Description N/A

Current Container Comments This waste is packaged in 30-gallon drums

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Waste consists of soils (approximately 60%) and associated sludge type wastes to be generated through environmental restoration activities at the Idaho National Engineering Laboratory's Subsurface Disposal Area (Pit 9). The sludge waste originated at the Rocky Flats Plant from various treatment processes in building 774. Sludge wastes included in the waste stream correspond to the following ID numbers: IN-W216, First Stage Sludge; IN-W228, Second Stage Sludge; IN-W309, Organic Setups Oil Solids; IN-W157, Special Setups (Cement); IN-W315, Evaporator Salts; IN-W276, Graphite. Graphite waste generated at the Rocky Flats Plant for casting plutonium metal is also included in the overall waste stream. The originally disposed sludges, graphite and surrounding soils are packaged in a single waste stream through environmental restoration retrieval and repackaging activities.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Waste consists of combustible and noncombustible heterogeneous debris generated through environmental restoration activities at the INEEL Subsurface disposal area (Pit 9). The debris includes drum remnants of sludge waste packaging material that originated at the Rocky Flats Plant from various treatment processes in building 774. Original packaging material (if still present) are segregated during retrieval operations and combined with noncombustible and combustible debris streams that originated at the Rocky Flats Plant. The original noncombustible and combustible debris streams are similar to the following ID numbers: IN-W169, dry Paper and Rags; IN-W278, Low Specific Activity Metal, Glass Etc.; and IN-W296, Non special Source Metal. The materials are combined in a single waste stream through environmental restoration retrieval repackaging activities.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream was generated at the Idaho Chemical Processing Plant at the INEEL, and may include both combustibles and noncombustibles. The waste includes a solidified sludge of acid-dissolved fuel, absorbed into diatomaceous earth. Other materials in the wastes include glass containers, plastics, metal scraps, lead shielding, and lab equipment.

The waste is contained in two 30-gallon drums. At least one of the drums may be lead-lined. The sludge is contained in glass bottles and sealed inside metal cans. Other materials may include glass containers, plastics, metal, scraps, lead shielding, and miscellaneous laboratory equipment. The surface dose rate is limited to 30 R/hr.

Waste Stream Source Description N/A

Current Container Comments N/A

EPA Comments N/A

Management Comments This waste stream was previously reported under IN-W257.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste, generated at Rocky Flats Plant, consists of liquids absorbed on a cement mixture. The liquid wastes are not compatible with aqueous treatment processes and are handled separately due to their plutonium complexing nature.

The majority of complexing chemical wastes are generated by various operations at Building 771, Plutonium Recovery operations. All waste are processed by aqueous waste treatment, building 774. The complexing chemicals include some alcohols, organic acids, and versenes (trademark for a series of chelating agents based on EDTA). All liquids are analyzed or assayed prior to release to Building 774 for treatment. Only below-discard contaminated wastes are released for processing. Above discard contaminated wastes are processed by plutonium recovery operations.

The cement mixture used for absorbing complexing liquid wastes is composed of approximately 190 lb of Portland cement and 50 lb of pipe insulation cement, such as magnesia cement. The cements are placed in a prepared 55-gallon drum; the drum is then placed on a drum roller and rolled to ensure mixing of the cements. All liquid wastes are made basic prior to adding them to the cement mixture. Approximately 100 liters of liquid waste is then poured on the cement mixture and allowed to solidify. Approximately 10 to 15 lb of portland cement is then added on top of the cemented liquid waste before the o-ring bag is removed from the glovebox.

Since 1972, drums have been inspected for free liquids, proper packaging, and the use of proper content code. One to two quarts of oil-dri was placed on top of the outer, sealed polyethylene drum bag after inspection. In 1982, vermiculite replaced oil-dri to fill the remaining space between the outer, sealed polyethylene drum bag and the top of the rigid liner.

Some drums may be filled with the empty polyethylene bottles used to transport the liquid waste to Building 774. A small amount of portland cement is added to each bottle before placement in a drum.

Waste Stream Source Description This waste stream was generated at Building 771: Plutonium recovery.. The generating process is: Aqueous waste treatment.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

Acceptance Comments N/A

Final Form Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream, generated at Mound Laboratory, consists of dry evaporator and dissolver sludge and insoluble residue. The consistency ranges from powder to sand-like particles. Limited amounts of other noncombustible wastes including Content Codes 803, 805, 810, 813, 814, 826, and 832 may be included. A few containers may have limited amounts of beryllium-contaminated wastes including glass, paper, gloves, and sample precipitates.

There is a potential for and lack of information on fines. In addition the drums may contain free liquids. The expected organic content in the drums is less than 14lb/ft3. No explosive, pyrophoric, or corrosive materials should be in the waste.

After removal from the bottom of dissolver pots, the dried sludge is rinsed with nitric acid and dried on a hotplate. Dried sludges are packaged in 1/2-gallon metal cans and sealed in a PE bag, or else packed in 1/2-gallon plastic-coated cardboard cartons and sealed in a PE bag. Each container is assayed and placed in PVC or PE sleeve bags. Sleeve bags can hold up to 5 containers per bag. Up to 8 sleeve bags are placed in each prepared 55-gallon drum. Drums are prepared according to post-1972 procedures, with plywood spacers as needed between on top of the rigid drum liner lid.

Waste Stream Source Description This waste stream was generated at Plutonium Processing Building: Plutonium Processing and Recovery.. The generating process is: Evaporator and dissolver sludge.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done. D009 will not be applicable to this waste stream after cartons of liquid mercury are removed.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.

Acceptance Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	<p>This waste stream, generated at Rocky Flats Plant, includes Oil-Dri absorbent and waste from laundry and utility operations.</p> <p>Organic content should be less than 14 lb/ft³. No sludges or free liquids should be present. The Oil-Dri should meet WIPP immobilization standards. No explosive or pyrophoric materials should be in this waste.</p> <p>The material is contained in 55-gallon drums. Inside the drums, the waste may be contained in PE bottles and/or metal paint cans and double-bagged in PE and PVC bags. Some waste may also be contained in PE residue process containers (RPCS). Drums were prepared and inspected according to pre and post-1972 procedures. Starting in 1982, vermiculite instead of Oil-Dri was used in the tops of the drums.</p> <p>The waste matrix composition listed is for the incinerator waste. No information is available concerning the laundry and utility operation waste.</p>
Waste Stream Source Description	<p>This waste stream was generated at Bldgs 771 and 776: Incineration. The generating process is: Separation of Oil-Dri from incinerable waste.</p>
Current Container Comments	<p>N/A</p>
EPA Comments	<p>The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.</p>
Management Comments	<p>Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.</p>
Acceptance Comments	<p>N/A</p>
Final Form Comments	<p>N/A</p>

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Organic and sludge immobilization system (OASIS) waste consists of cutting oil and organic solvents solidified with Envirostone emulsifier, gypsum concrete, and an accelerator.

Except for the solidifying agent, the waste is similar to Item Description Code (IDC) 003 waste, and has been assigned the same Waste matrix composition.

Waste Stream Source Description This waste stream was generated at Building 774: Plutonium Manufacturing.. The generating process is: Solidification of solvents and oils.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste is from Rocky Flats. The waste consists of sludge from laundry operations that have been cemented in portland. The cement is described as a poor grade.

Waste Stream Source Description This waste stream was generated at Building 776: Laundry. The generating process is: Laundry sludge.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

Acceptance Comments N/A

Final Form Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Waste consists of a wet sludge produced from treating aqueous process wastes, such as ion exchange column effluent, distillates, and caustic scrub solutions generated by Plutonium Recovery Operations (Building 771). Portland cement is added to the waste package for absorption of free liquids. Waste drums may periodically contain surgeons' gloves, glovebox gloves, etc.

Since the fall of 1979, first-stage sludge (IDC 001) and Second stage sludge (IDC 002) have been combined into Content Code 1 - Combined sludge.

Sludge is produced by treating aqueous wastes by the carrier precipitation process. Aqueous wastes are made basic, if necessary, with sodium hydroxide. Radioactive elements such as plutonium and americium are chemically precipitated from the liquid waste. Treatment chemicals include ferric sulfate, calcium chloride, magnesium sulfate, and flocculating agents. The treatment process produces a precipitate of the hydrated oxides of iron, magnesium, aluminum, silicon, etc., which also carries the hydrated oxides of plutonium and americium. The precipitate or slurry is filtered to produce a sludge containing 50 to 70 weight percent water.

Liquid wastes were analyzed for fissile content prior to release from Building 771 and 774, and were retained at Building 771 for further treatment if contaminated with above-discard amounts of plutonium.

Waste Stream Source Description This waste stream was generated at Building 774: Aqueous Waste Treatment.. The generating process is: Aqueous process waste treatment.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Building 374 solidified sludge consists of immobilized low-level mixed waste materials from decontamination-precipitation and neutralization processes in the Building 374 Liquid Waste Treatment Facility. The wastewater treatment operation includes neutralization, radioactive decontamination (precipitation), filtration, evaporation, spray drying, salt immobilization, and filtrate sludge immobilization. The sludge from the rotary drum vacuum filter has a dry appearance but is still very moist. The dried sludge was transferred from the dryer directly into a 55-gallon drum. The resulting waste consisted of dispersible fines and was assigned IDC 007.

Waste Stream Source Description This waste stream was generated at Bldg 374: Uranium and Plutonium Processing.. The generating process is: Aqueous waste filtration and solidification.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream, generated at Bettis Atomic Power Laboratory, consists of solidified grinding sludge and associated filters, rags, etc. The sludge can contain abraded grinding wheel material, which includes diamond dust, aluminum oxide, carborundum, and rubber. The waste is in either powder or cakes and contains not more than 10% of other waste items.

There are high levels of fines. In addition the drums may contain free liquids. The estimated organic content is less than 1 lb/ft³. No particle size data are provided, but it is assumed that WIPP-WAC limits for fines would be exceeded. No free liquids should be present. No explosive, pyrophoric, or corrosive material should be in the waste.

Both 17c and 6m 55-gallon drums were used for packaging the waste. Fissile content was determined by calculating the weight difference by chemical analysis or by an assay gauge.

Waste Stream Source Description This waste stream was generated at L Building: Fuel Manufacturing.. The generating process is: Grinding operations.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.

Acceptance Comments N/A

Final Form Comments All containers of this TWBIR waste stream are included in the amount listed above. See 8.2.15.1.13 for the years.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	<p>This waste includes waste generated at ANL-East and solid wet sludge from the Rocky Flats Plant. The ANL-E waste is derived from research activities performed in a laboratory environment. The waste includes concrete and laboratory apparatus. The waste is packaged in 55-gallon drums or in SWBs.</p> <p>The solid wet sludge is cemented or dewatered sludge precipitated from aqueous waste treatment processes. Soils that are not contaminated with organic chemicals are also included.</p> <p>Rocky flats waste included in 111 is IDC 007, Building 374 solidified sludge. IDC 007 consists of immobilized low-level mixed waste materials from decontamination-precipitation and neutralization processes in the Building 374 Liquid Waste Treatment Facility. The wastewater treatment operation includes neutralization, radioactive decontamination (precipitation), filtration, evaporation, spray drying, salt immobilization, and filtrate sludge immobilization. The sludge from the rotary drum vacuum filter has a dry appearance but is still very moist. The dried sludge was transferred from the dryer directly into a 55-gallon drum. The sludge was dried, or had portland cement and diatomite added to absorb liquids.</p> <p>Note: Waste matrix composition listed is for Rocky Flats Waste.</p>
Waste Stream Source Description	<p>This waste stream was generated at RFP: Bldgs 374, 774, ANL-E: Bldgs 205, 350: Uranium and Plutonium Processing.. The generating process is: Aqueous waste treatment processes.</p>
Current Container Comments	<p>N/A</p>
EPA Comments	<p>The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.</p>
Management Comments	<p>Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.</p>
Acceptance Comments	<p>N/A</p>
Final Form Comments	<p>N/A</p>

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Solid lab waste consists of cemented or absorbed neutralized aqueous laboratory waste and includes some waste from IDCs 004 and 292.

Waste matrix composition listed is for IDC 004 waste, which accounts for most of the waste in this content code.

Waste Stream Source Description This waste stream was generated at Bldg 774 , Rocky Flats Plant: Laboratory Operations.. The generating process is: Aqueous waste treatment.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

Acceptance Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream, generated at Rocky Flats Plant, consists of sludge from the incinerator off-gas system, recovery building filter plenums, pumps, etc. Portland cement is added to absorb free liquids. The sludge may contain a limited number of surgical gloves. Content Code 292 replaced Code 290 in 1974.

Before 1977, sludge was sealed in PVC bags, double-contained in plastic and placed in 1-gallon metal paint cans. Portland cement was added to the bottom and top of the can. After 1977, sludge was placed in 1-gallon PE bottles with layers of portland cement. Each can (or bottle) was assayed and placed in groups of about 25 into prepared 55-gallon drums. Drum preparation was in accordance with pre and post 1972 procedures. Starting in 1982, vermiculite replaced Oil-Dri as the material between the top of the waste material and the drum liner lid.

Waste Stream Source Description This waste stream was generated at Bldg 771, Rocky Flats Plant: Plutonium Recovery Operations.. The generating process is: Filter sludge.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Waste consists of a wet sludge produced from treatment of all other plant radioactive and/or chemical contaminated wastes and further treatment of the first-stage effluent. Portland cement was added to the waste package for absorption of free liquids.

Second-stage sludge drums packaged prior to 1973 may contain other waste such as electric motors, bottles of chemical (usually liquid) wastes, mercury and lithium batteries, and small amounts of contaminated mercury in pint bottles. Radioactive sources were also periodically included in second-stage drums through 1979.

Since the fall of 1979, Second stage sludge (IDC 002) have been combined into Content Code 1 - Combined sludge. Content code 2 is no longer used.

Sludge is produced by treating aqueous wastes by the carrier precipitation process. Aqueous wastes are made basic, if necessary, with sodium hydroxide. Radioactive elements such as plutonium and americium are chemically precipitated from the liquid waste. Treatment chemicals include ferric sulfate, calcium chloride, magnesium sulfate, and flocculating agents. The treatment process produces a precipitate of the hydrated oxides of iron, magnesium, aluminum, silicon, etc., which also carries the hydrated oxides of plutonium and americium. The precipitate or slurry is filtered to produce a sludge containing 50 to 70 weight percent water.

Liquid wastes were analyzed for fissile content prior to release from Building 771 and 774, and were retained at Building 771 for further treatment if contaminated with above-discard amounts of plutonium.

Waste Stream Source Description This waste stream was generated at Building 774: Aqueous Waste Treatment.. The generating process is: Aqueous process waste treatment.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream, generated at the Rocky Flats Plant, consists of glass sample vials, bottles, lead-taped sample vials, ion exchange columns, dissolver pots, laboratory glassware such as pyrex flasks and beakers, glovebox windows (glass, plexiglass, leaded glass), and crushed and ground glass. The waste includes limited amounts of other noncombustibles such as metals, and limited amounts of combustible wastes. No sludges should be present although some glass vials may contain limited amounts of free liquids. No explosive, pyrophoric, or corrosive materials should be in the waste.

Drums may contain respirable crushed glass fines or free liquids .

The glass may be packaged with some variation depending on if it is whole, broken to pieces, or crushed or ground. Whole or broken glass may be packaged in 1-gallon PE bottles, in 13-inch high by 15.5-inch diameter Fibre-Paks (either loose or inside plastic bags inside the Fibre-Pak), or double -packed in plastic bags, with the outside of the outer bag taped for protection against sharp edges. Glassware such as sample vials may be taped together before packaging. Nonline generated glassware, light bulbs, and fluorescent tubes are usually crushed or ground and placed directly into a prepared 55-gallon drum. Drums were packed according to the usual pre-1972 and post-1972 procedures. Specific information on the box preparation was not available.

Each drum was assayed. Since 1972, the drums were also processed according to inspection and sealing procedures; and, since 1982, vermiculite instead of Oil-Dri was placed on top of the outer sealed PE drum bag. A small number of the drums are lead-lined. Also, Oil-Dri was added to the glass waste if moisture was present.

Waste Stream Source Description This waste stream was generated at All plutonium areas.: Plutonium Operations.. The generating process is: Various

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

Acceptance Comments N/A

Final Form Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream, generated at the Rocky Flats Plant, consists of boronated glass rings used to minimize neutron multiplication in liquid storage tanks. Unleached Rashig Rings were used from 1971-79 as a separate stream and then combined with content code 442, Leached Rashig Rings. The rings are about 1.75 inch high and 1.5 inch in diameter, with a 0.25-inch wall thickness. The rings are heat and chemical resistant borosilicate glass with 11.8 - 13.8 weight % B₂O₃, with an isotopic content of 10B/11B of not less than 0.24. Some of the rings, which had above-discard amounts of plutonium, were leached with nitric acid to recover the plutonium and then rinsed with water and dried. Some of the rings may be contaminated with small amounts of oil.

No sludges or free liquids should be present. No explosive or pyrophoric materials should be in the waste. Trace amounts of nitric acid or organic contaminants may be present.

The rings are triple contained in PE or PVC and placed in a 10-inch high, 15.5-inch diameter Fibre-Pak. Two Fibre-Paks are placed inside a prepared 55-gallon drum according to the standard pre-1972 and post-1972 drum packing procedures. A few of the drums contain broken rashig rings in taped-closed, 4-liter PE bottles with double bags inside the bottles.

Each drum was assayed. Since 1972, the drums were also processed according to inspection and sealing procedures; and, since 1982, vermiculite instead of Oil-Dri was placed on top of the outer sealed PE drum bag. A small number of the drums are lead-lined. Also, Oil-Dri was added to the glass waste if moisture was present.

Waste Stream Source Description This waste stream was generated at Plutonium Areas.: Plutonium Operations.. The generating process is: Neutron buffering.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream, generated at Mound Laboratory, consists mostly of whole and broken glassware and glass sample vials. The majority of the glass is pyrex. Limited amounts of other noncombustibles, material similar to that in Content Codes 803, 805, 811, and 826 may be present. Even though some of the glassware is broken, fines should not exceed WIPP-WAC limits for repairable or dispersed fines. No inorganic sludges, no explosive, pyrophoric, or corrosive materials should be in the waste.

Most of the glassware is broken into pieces about 1 inch in diameter to reduce total volume. The material is packaged into 1 or 2-quart metal cans with lids. Each can is assayed for plutonium content and then placed with up to four other cans into a sleeve bag, which is sealed with tape. Up to five sleeve bags are placed inside a drum. Each drum is lined with a 90-mil drum liner, which is lined with a PE drum bag. Plywood spacers are placed between the rigid liner lid and the drum lid.

Waste Stream Source Description This waste stream was generated at Plutonium Processing Laboratory and PP Bldg.: Laboratory Operations.. The generating process is: Neutron buffering.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done. Waste is expected to be non-mixed when cartons of liquid mercury are removed.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.

Acceptance Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste, generated at Mound Laboratories, consists of soil, including small rocks and pebbles, generated from cleanup of a leak. All soil waste was dry when packaged. A few waste boxes also include picks, shovels, metal cans, rubber gloves, booties, respirators, plastic, and possibly an air hammer and chisel. Soils waste was packaged in small, plastic lined plywood boxes (42 x 20 x 39 inch) other waste was then placed on top of the soil before the box was sealed. Four of the small boxes were then packaged in a standard larger waste box (4 x 4 x 7 feet) lined with fiberglass-reinforced polyester. Assay was performed using radiochemical analysis on core samples taken from the contaminated area.

Waste Stream Source Description This waste stream was generated at Plutonium Processing - Waste Disposal Area: Plutonium Processing.. The generating process is: Cleanup of a leak.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream, generated at the Rocky Flats Plant, consists of grit such as aluminum oxide and iron fines and pellets used in grit-blasting operations and spent silica gel desiccant.

The only organic material is the packaging, which averages about 5 lb/ft³, excluding the drum liner. No sludges or free liquids should be present. No explosive or pyrophoric materials should be in this waste.

The material is contained in 55-gallon drums. Inside the drums, the grit may be contained in PVC or PE bags in Vollrath stainless steel cans, or in 1-gallon PE bottles inside PVC and PE bags. Silica gel is placed directly into the prepared drums. Drums were prepared and inspected according to pre- and post-1972 procedures.

Waste Stream Source Description This waste stream was generated at Bldgs 777, 776, and 771: Assembly, Laundry, Plutonium Recovery.. The generating process is: Grit blasting.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

Acceptance Comments N/A

Final Form Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Organic setups are produced from treatment of liquid organic wastes generated by various plutonium and nonplutonium operations. The organic wastes are mixed with calcium silicate to form a grease or paste-like material. Small amounts of oil-dri absorbent are usually mixed with the waste.

Organic wastes such as degreasing agents (primarily trichloroethane), lathe coolant (machining oil and carbon tetrachloride), and hydraulic oils are generated primarily by plutonium fabrication operations. Other organic wastes include carbon tetrachloride; trichloroethylene; hydraulic, gearbox, and spindle oils; and trace concentrations of miscellaneous organic laboratory wastes. (organophosphates, nitrobenzene, etc.) In addition, unknown volumes of oil containing polychlorinated biphenyls (PCB) were processed with other organic wastes until 1979. Degreasing solvents generated by Building 444 operations are contaminated with beryllium. The PCB-contaminated wastes will be treated to meet WIPP-WAC.

Waste Stream Source Description This waste stream was generated at All plutonium areas: Plutonium operations.. The generating process is: Mostly machining oils.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Waste is generated at Rocky Flats Plant from aqueous waste treatment in building 774. Waste consists of a salt residue generated from concentrating and drying liquid waste from the solar evaporation ponds. The approximate chemical makeup of the salt is 60% sodium nitrate, 30% potassium nitrate, and 10% miscellaneous. Limited amounts of other wastes such as surgeons' gloves, paper, rags, and metal may be found in the waste drums. Portland cement was added to damp or wet salt when necessary.

The majority of salt drums in storage at the INEL should be contaminated with <10 nCi/g TRU. Salt waste is no longer shipped to the INEL.

Since 1972, drums have been inspected for free liquids, proper packaging, and use of the proper content code. After inspection, approximately 1 to 2 quarts of Oil-Dri was placed on top of the outer sealed polyethylene drum bag.

Waste Stream Source Description This waste stream was generated at Building 774: Aqueous Waste Treatment. The generating process is: Concentrating and drying liquid waste.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	This waste, generated at the Rocky Flats Plant, consists of anionic and cationic exchange resins used in the purification and recovery of plutonium and americium, respectively. It is believed that the resins were Content Code 430 resins that were processed by leaching to recover plutonium. Content code was used during 1972 only.
Waste Stream Source Description	This waste stream was generated at Bldg 771: Plutonium Recovery Operations.. The generating process is: Purification and recovery of plutonium and americium.
Current Container Comments	N/A
EPA Comments	The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream was generated at the INEL. These wastes include actinide neutron sources, a radium needle, small vials of fuel, and metal containers of experimental fuel capsules.

The organic content is less than 14 lb/ft³. Combustibles, including packaging, may exceed 25 volume percent. The levels of dispersible fines should be within WIPP-WAC limits. No sludges or free liquids should be present. No explosive or pyrophoric materials should be in this waste.

These wastes are packaged three different ways, depending on when the packaging was done. Pu-Be sources packaged in 1975 were placed in a carbon steel pipe, which was cemented and encapsulated into the center of a 55-gallon drum. In 1978, Pu-Be sources were packaged in four 55-gallon drums. Wastes packed in 1980 were wrapped plastic, placed in paraffin lined 15-gallon drums, and then placed in 55-gallon drums.

Waste Stream Source Description This waste stream was generated at Bldgs 660 and 661: UNK. The generating process is: UNK

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.

Acceptance Comments N/A

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.

Acceptance Comments N/A

Final Form Comments All containers of this TWBIR waste stream are included in the amount listed above. See 8.2.15.1.13 for the years.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream was generated at the Argonne National Laboratory-West at the INEL. Most of the waste is organic and combustible materials including paper, wood, PVC and plastic containers and items, rubber gaskets and gloves, leather, rags, towels, Q-tips, tubing, filter media, abrasive media, and metal pieces. Small residuals of moderators and fuel are trapped on the filters. One of the 28 total drums of Content Code 153 waste is stored at the Transuranic Storage Area (TSA) for contact-handled waste. The other 27 drums are stored at the intermediate level transuranic storage facility (ILTSF) for remote handled waste.

The organic content may exceed 14 lb/ft³. Combustibles, including packaging, may exceed 25 volume percent. The levels of dispersible fines should be within WIPP-WAC limits. No sludges or free liquids should be present. No explosive or pyrophoric materials should be in this waste.

Individual waste items may be loose or plastic bagged. Combustibles and noncombustibles are segregated to separate waste cans. Each can is weighed and assayed. The inner waste cans are loaded into an outer waste drum, along with a lead shield plug. Assays are done for each can and for the drums.

The waste stream is non-mixed, because the lead is shielding only and not considered part of waste stream.

Waste Stream Source Description This waste stream was generated at UNK: UNK. The generating process is: UNK

Current Container Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste was generated at the Idaho National Engineering Laboratory. It consists of an americium neutron source. No other wastes were included in the drum.

The waste was placed in a carbon steel pipe which was centered in the 55-gallon drum. Cement was added to fill the annular space between the pipe and drum and encapsulate the pipe containing the source.

Waste Stream Source Description This waste stream was generated at Test Area North: Instrument Calibrations.. The generating process is: Source disposal.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	This wastestream, which was generated at ANL-W was generated during analytical chemistry and metallography operations. Item Description Code (IDC) 153 was replaced by IDC 160, ANL-W HFEF Analytical Chemistry and Metallographic Combsutibles. The waste package contains lead as shielding.
Waste Stream Source Description	This waste stream was generated at Argonne National Laboratory-West: UNK. The generating process is: Analytical chemistry & metallography.
Current Container Comments	N/A
EPA Comments	The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.
Management Comments	Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.
Acceptance Comments	N/A
Final Form Comments	N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists of insoluble residue or "heel" generated from processing magnesium oxide sand and pulverized slag and magnesium oxide crucibles to remove above-discard amounts of plutonium. Respirable fines are thought to exceed the WIPP-WAC limits.

The waste stream handling and packaging is as follows: the dried heels were placed into 1/2 and 1-gallon PE bottles. Each bottle was double -bagged out the glovebox in PVC and PE bags. Each bottle was assayed and then placed in prepared 55-gallon drums, about 15-30 bottles per drum. Prior to 1972, the drums were lined with one or two PE bags, which were sealed with tape. Some of these drums may have cardboard liners inside the inner drum bag. After 1972, 90-mil sealed rigid liners were used in addition to one or two PE bags.

Since 1972, drums were inspected (and corrected where needed for free liquids, proper packaging, and proper content code. One to two quarts of Oil-dri was placed on the outer sealed PE drum bag. Starting in february 1982, 3-12 lb of vermiculite was used to fill the space between the outer drum bag and the rigid liner.

Waste Stream Source Description This waste stream was generated at Bldg 771: Plutonium Recovery.. The generating process is: Leaching of sand, slag, and crucibles.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is from Bettis Atomic Power Laboratory. It consists of a single drum of TRU. No more information is available, but the waste is thought to be solidified inorganic solutions.

Waste Stream Source Description This waste stream was generated at UNK: UNK. The generating process is: UNK

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.

Acceptance Comments N/A

Final Form Comments All containers of this WTWBIR waste stream are included in the amount listed above. See 8.2.15.1.13 for the years.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	This waste , generated at the Rocky Flats Plant,consists of ash generated from the experimental pilot and demonstration fluid bed incinerator plants. Combustibles used for experiments were contaminated with low levels of Pu. Ash is packaged in standard RFP drums. Drums were assayed and fissile quantities calculated.
Waste Stream Source Description	This waste stream was generated at Building 776: Plutonium Operations.. The generating process is: Fluid bed incineration ash.
Current Container Comments	N/A
EPA Comments	The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.
Management Comments	Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream was generated at Argonne National Laboratory-West at the INEL. These wastes consist of noncombustible materials including Pu-Be neutron sources (small fuel samples, small sections of moderator, a pu standard, and pu foil), tools, hot cell operating equipment, various containers, and ferrous and nonferrous metals. Some combustible materials may include paper, plastic and PVC containers, rags, Q-tips, string mop heads, and an electrical plug strip and cord.

The organic content is less than 14 lb/ft³. Combustibles, including packaging, may exceed 25 volume percent. The levels of dispersible fines should be within WIPP-WAC limits. No sludges or free liquids should be present. No explosive or pyrophoric materials should be in this waste.

These wastes are packaged three different ways, depending on when the packaging was done. Pu-Be sources packaged in 1975 were placed in a carbon steel pipe, which was cemented and encapsulated into the center of a 55-gallon drum. In 1978, Pu-Be sources were packaged in four 55-gallon drums. Wastes packed in 1980 were wrapped plastic, placed in paraffin lined 15 gallon drums, and then placed in 55-gallon drums. Some individual items may be unbagged.

Waste Stream Source Description This waste stream was generated at TAN, NRF and ANL-W: Various. The generating process is: Discarded sources.

Current Container Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	This waste, generated at the Rocky Flats Plant, consists of flyash generated from periodic cleaning of the Pu recovery incinerator off-gas system. Ash is packaged in 1- and 2-quart PE bottles and then in standard RFP fashion in drums. Drums will hold up to 50 bottles depending on Pu content. Bottles are individually assayed and fissile quantities calculated.
Waste Stream Source Description	This waste stream was generated at Building 771: Plutonium Recovery Operations.. The generating process is: Pu recovery incinerator fly ash.
Current Container Comments	N/A
EPA Comments	The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.
Management Comments	Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste, generated at the Rocky Flats Plant, consists of ash heels generated from the recovery of Pu from incinerator ash. Ash is packaged in 0.5- and 1-gallon PE bottles and then in standard RFP fashion in drums. Drums will hold up to 25 bottles depending on Pu content. Bottles are individually assayed and fissile quantities calculated.

Waste Stream Source Description This waste stream was generated at Building 771: Plutonium Recovery Operations.. The generating process is: Leach of Pu recovery incineration ash.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

Acceptance Comments N/A

Final Form Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists of broken magnesium oxide crucibles and limited amounts of magnesium oxide sand, used in a molten salt cleanup project when reducing plutonium tetrafluoride to plutonium metal. Above-discard levels of plutonium were recovered from these crucibles by nitric acid leaching.

The waste stream handling and packaging is as follows: the crucibles were placed into 1-gallon PE bottles. Each bottle was double-bagged out the glovebox in PVC and PE bags. Each bottle was assayed and the placed in prepared 55 gallon drums, about 12-16 bottles per drum. Some of the drums were lead-lined. Prior to 1972, the drums were lined with one or two PE bags, which were sealed with tape. Some of the drums may have cardboard liners inside of the inner liner. After 1972, 90-mil sealed rigid liners were used in addition to one or two PE bags.

Since 1972, drums were inspected (and corrected where needed) for free liquids, proper packaging, and proper content code. One to two quarts of Oil-dri was placed on the outer sealed PE drum bag. Starting in February 1982, 3-12 lb of vermiculite was used to fill the space between the outer drum bag and the rigid liner.

Waste Stream Source Description This waste stream was generated at Bldg 776 and 771: Pyrochemical and Plutonium Recovery Operations.. The generating process is: Plutonium recovery.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

Acceptance Comments N/A

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream includes blank LECO crucibles and caps used for sample analysis. The crucibles are 1 inch high by 1 inch diameter, made of fired silica based ceramic. The crucibles were used to calibrate the LECO analyzer, and contain fused amounts of accelerating metals (iron, tin, copper, titanium, stainless steel, etc.) used for blank calibration. The crucibles should be unbroken except for those generated prior to 1975, which were broken before packaging. Even when broken, there should be minimal respirable or dispersible fines which would not exceed the WIPP-WAC.

The waste stream handling and packaging is as follows: blank crucibles and caps were placed into 1-gallon metal paint cans, about 150-200 per can. The can lid was placed and sealed with tape. Each paint can was double-bagged out the glovebox in PVC or PE-PVC bags and placed in prepared 55-gallon drums, about 20-25 cans per drum. Prior to 1972, 90-mil sealed rigid liners were used in addition to the two PE bags.

Since 1972, drums were inspected (and corrected where needed) for free liquids, proper packaging, and proper content code. One to two quarts of Oil-dri was placed on the outer sealed PE drum bag. Starting in February 1982, 3-12 lb of vermiculite was used to fill the space between the outer drum bag and the rigid liner.

Waste Stream Source Description This waste stream was generated at Bldg 559: Plutonium Laboratory.. The generating process is: Sample analysis.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description There is no descriptive or constituent information available for this waste, which was generated at Bettis Atomic Power Laboratory.

Waste Stream Source Description This waste stream was generated at UNK: UNK. The generating process is: UNK

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.

Acceptance Comments N/A

Final Form Comments All containers of this WTWBIR waste stream are included in the amount listed above. See 8.2.15.1.13 for the years.

Original data showed 6 RH Canisters. Int. volume and # stored changed to more accurately reflect the waste volume of 4.7 m3 as follows:
4.7 m3 / .208 m3 / drum = 22.596 drums, rounded to 23 drums.
Tb 3/27/03.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream, generated at the Rocky Flats Plant, is sewage sludge from cleaning stabilization ponds. This waste also contains a limited number of drums containing sludge generated by plutonium recovery operations. The sludge may be moist or dry, and may consist of fines, chunks or pieces of dried cake. Shipment of sewer sludge to the INEL stopped in 1976.

There are high levels of fines. In addition the drums may contain free liquids. The sewage sludge should contain less than 10 nCi/g TRU elements. The portion of the waste that is suspected to be TRU is addressed by this waste stream. Organic content in the sludge is not known. No free liquids should be present. No explosive, pyrophoric, or corrosive materials should be in the waste.

Sewer sludge was placed directly into prepared 55-gallon drums until 1974. Drums were prepared according to pre and post-1972 procedures. Portland cement was added to the bottom and top of the inner bag. If the sludge was moist, portland cement was also added in layers with the sludge. Since 1974, packaging was changed to 4 x 4 x 7 ft fiberglass-reinforced polyester (FRP) coated plywood boxes due to the pressure buildup in the drums. Each box was lined with a PE bag and a cardboard liner. About 90 lb of portland cement was added to the bottom and top of each box. Fissile content of the sewage was determined by radiochemical analysis of sludge samples.

Waste Stream Source Description This waste stream was generated at Bldgs 995 and 771: Sewage Treatment and Plutonium Recovery.. The generating process is: Cleaning stabilization ponds.

Current Container Comments N/A

EPA Comments The EPA list in 3.4.3 is based on generator supplied process knowledge and/or headspace gas sampling. No TCLP or Total Analysis has been done.

Management Comments Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

Acceptance Comments N/A

Final Form Comments N/A

Waste Stream Description Organic and inorganic particulate and debris.

Waste Stream Source Description Waste from laboratory testing and analysis.

Current Container Comments N/A

EPA Comments Material in this waste stream is not a hazardous waste.

Management Comments N/A

Acceptance Comments The current inventory identified in section 4.1.2.1 and the projected generation identified in section 5.1.3 consists of stored TRU which has not been completely characterized. It is expected that 20% of this material will be finally classified as LLW or MLLW. It is expected that 10% of this material will be finally classified as MTRU waste (KA-W016). The remainder will be finally classified as TRU waste. Data date is 12/31/01.

Final Form Comments KAPL expects that once the 5 gallon container is in the 55 gallon drum, the 55 gallon drum will be CH, but that would not change the characterization of the waste.

Waste Stream Description This transuranic mixed waste has not yet been generated. Waste will be segregated to the extent possible (considering ALARA) into inorganic, organic and heterogeneous waste streams and packaged separately. Details of waste characteristics will be developed upon generation. This waste stream will not be moratorium waste.

Waste Stream Source Description Waste generated through R&D programs

Current Container Comments N/A

EPA Comments This waste has not yet been generated. The identification of hazardous constituents listed is based on process knowledge of potential contaminants.

Management Comments N/A

Acceptance Comments This data is consistent with the data provided to the State and EPA in the Proposed Site Treatment Plan. Data date is 12/31/01.

Final Form Comments N/A

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Off-Site Source Recovery (OSR) sealed sources are radionuclide (actinide) solids (e.g., Am, Pu, AmBe, or PuBe) that are encapsulated in metal jackets. The actinides are either metal or metal oxides.

Waste Stream Source Description N/A

Current Container Comments N/A

EPA Comments N/A

Management Comments Contains containers not previously associated with an identified BIR WS

Acceptance Comments N/A

Final Form Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Combustible waste generated from facility and equipment operations and maintenance. This waste includes paper, rags, plastic, rubber, wood-based HEPA filters, and plastic-based and cellulose-based waste generated at the facility. Plastic-based waste includes, but may not be limited to, tape, polyethylene and vinyl; gloves; plastic vials; polystyrene; Tygon tubing; polyvinyl chloride plastic; Teflon products; Plexiglas; and dry box gloves (unleaded neoprene base). Cellulose-based waste includes, but may not be limited to, rags, wood, paper, cardboard, laboratory coats and coveralls, booties and cotton gloves, and similar materials. The waste stream may also contain a smaller fraction of non-combustible solids (e.g., scrap metal, crucibles, metal lids, zippers, discarded tools) and a small fraction of homogenous solids, salts, leached solids, ash, hydroxide cakes, crucibles, impure oxides.

Waste Stream Source Description N/A

Current Container Comments N/A

EPA Comments N/A

Management Comments Former WS IDs: LAM001, LAM004, LAT004, LAT005, LAT009, also contains containers not previously associated with an identified BIR WS.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Combustible waste generated from facility and equipment operations and maintenance. This waste includes paper, rags, plastic, rubber, wood-based HEPA filters, and plastic-based and cellulose-based waste generated at the facility. Plastic-based waste includes, but may not be limited to, tape, polyethylene and vinyl; gloves; plastic vials; polystyrene; Tygon tubing; polyvinyl chloride plastic; Teflon products; Plexiglas; and dry box gloves (unleaded neoprene base). Cellulose-based waste includes, but may not be limited to, rags, wood, paper, cardboard, laboratory coats and coveralls, booties and cotton gloves, and similar materials. The waste stream may also contain a smaller fraction of non-combustible solids (e.g., scrap metal, crucibles, metal lids, zippers, discarded tools) and a small fraction of homogenous solids, salts, leached solids, ash, hydroxide cakes, crucibles, impure oxides.

Waste Stream Source Description N/A

Current Container Comments N/A

EPA Comments assumed mixed but codes unknown

Management Comments Former WS IDs: LAM004, LAT004, LAT005, LAT009

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Combustible and non-combustible remote handled waste (RH-TRU). This waste stream contains both combustible and non-combustible waste that is classified as "remotely handled". Combustible waste is generated from facility and equipment operations and maintenance. Combustible waste includes paper, rags, plastic, rubber, and plastic-based and cellulose-based waste generated at the facility. Plastic based waste includes, but may not be limited to, tape, polyethylene, and vinyl; gloves; plastic vials; polystyrene; Tygon tubing; polyvinyl chloride plastic; Teflon products; plexiglass; and dry box gloves (unleaded Neoprene base). Cellulose-based waste includes, but may not be limited to rags, wood, paper, cardboard, laboratory coats and coveralls, booties and cotton gloves, and similar materials. Noncombustible scrap waste is also generated from facility and equipment operations and maintenance. Noncombustible waste includes items such as small tools, cans, small equipment items, and broken glass. This waste consists of glass waste including, but not limited to, discarded labware, windows, and bottles; metal waste including motors, pumps, tools, and process equipment; leaded rubber, and metal waste including lead-lined glovebox gloves discarded along with metal waste, such as motors and tools.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Solidified aqueous waste and cemented sludge generated from facility and equipment operations and maintenance. The sludge is a residue from numerous treatment and filtration operations involving aqueous liquid radioactive waste. This treatment produces a thin sludge (approximately 25 percent solids) that is alkaline and is compatible with Portland cement. Final cemented waste monoliths are produced by mixing the waste in 55-gallon steel drums containing empirically determined quantities of sludge, Portland cement, vermiculite, and sodium silicate.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists mostly of metals or metal equipment, either whole or sectioned, and small volumes of combustibles generated during decommissioning, sectioning, and packaging. The waste forms primarily include gloveboxes, tools, cans, motors, pumps, decommissioned process equipment, and ductwork

Waste Stream Source Description N/A

Current Container Comments N/A

EPA Comments assumed mixed but codes unknown

Management Comments Former WS IDs: LAM001, LAM009, LAT009

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Combustible waste generated from facility and equipment operations and maintenance. This waste includes paper, rags, plastic, rubber, wood-based HEPA filters, and plastic-based and cellulose-based waste generated at the facility. Plastic-based waste includes, but may not be limited to, tape, polyethylene and vinyl; gloves; plastic vials; polystyrene; Tygon tubing; polyvinyl chloride plastic; Teflon products; Plexiglas; and dry box gloves (unleaded neoprene base). Cellulose-based waste includes, but may not be limited to, rags, wood, paper, cardboard, laboratory coats and coveralls, booties and cotton gloves, and similar materials. The waste stream may also contain a smaller fraction of non-combustible solids (e.g., scrap metal, crucibles, metal lids, zippers, discarded tools) and a small fraction of homogenous solids, salts, leached solids, ash, hydroxide cakes, crucibles, impure oxides.

Waste Stream Source Description N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Solidified aqueous waste generated from facility and equipment operations and maintenance. Solidified aqueous waste is a dewatered sludge generated by the vacuum filtration of solids from treated aqueous waste slurry. The filter media (diatomaceous earth) with the entrapped filtrate is then placed in drums with dry concreted absorbent.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Mixed metal scrap, discarded gloveboxes, and incidental combustible waste generated from facility and equipment decontamination and decommissioning at TA21. This waste consists mostly of metals or metal equipment, either whole or sectioned, gloveboxes, glovebox equipment, glass, and small volumes of combustibles generated during decommissioning. This waste may also include items such as small tools, cans, motors, and pumps. Gloveboxes may include gloves, wiring, plastic, glass windows, plastic wrapping, and lead shielding.

Waste Stream Source Description N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Combustible waste generated from facility and equipment operations and maintenance. This waste includes paper, rags, plastic, rubber, wood-based HEPA filters, and plastic-based and cellulose-based waste generated at the facility. Plastic-based waste includes, but may not be limited to, tape, polyethylene and vinyl; gloves; plastic vials; polystyrene; Tygon tubing; polyvinyl chloride plastic; Teflon products; Plexiglas; and dry box gloves (unleaded neoprene base). Cellulose-based waste includes, but may not be limited to, rags, wood, paper, cardboard, laboratory coats and coveralls, booties and cotton gloves, and similar materials. The waste stream may also contain a smaller fraction of non-combustible solids (e.g., scrap metal, crucibles, metal lids, zippers, discarded tools) and a small fraction of homogenous solids, salts, leached solids, ash, hydroxide cakes, crucibles, impure oxides.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Cemented wastewater treatment sludge from room 60 pretreatment of TA-55 liquid waste. Solidified aqueous waste and cemented sludge. The sludge is a residue from treatment and filtration operations involving aqueous liquid radioactive waste from TA-55, Building PF4. This treatment produces a thin sludge (approximately 25 percent solids) that is alkaline and is compatible with Portland cement. Final cemented waste monoliths are produced by mixing the waste in 55-gallon steel drums containing empirically determined quantities of sludge, Portland cement, vermiculite, and sodium silicate.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste mostly consists of metals or metal equipment, such as motors, pumps, tools, and process equipment, either whole or sectioned, and lesser amounts of combustible components. The waste also includes mixed metal scrap and incidental combustible waste generated from size reduction of equipment from various TAs throughout LANL. In addition, it contains small volumes of combustibles generated during decommissioning, sectioning, and packaging.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Combustible waste generated from facility and equipment operations and maintenance. This waste includes paper, rags, plastic, rubber, wood-based HEPA filters, and plastic-based and cellulose-based waste generated at the facility. Plastic-based waste includes, but may not be limited to, tape, polyethylene and vinyl; gloves; plastic vials; polystyrene; Tygon tubing; polyvinyl chloride plastic; Teflon products; Plexiglas; and dry box gloves (unleaded neoprene base). Cellulose-based waste includes, but may not be limited to, rags, wood, paper, cardboard, laboratory coats and coveralls, booties and cotton gloves, and similar materials. The waste stream may also contain a smaller fraction of non-combustible solids (e.g., scrap metal, crucibles, metal lids, zippers, discarded tools) and a small fraction of homogenous solids, salts, leached solids, ash, hydroxide cakes, crucibles, impure oxides.

Plastic-based waste includes, but may not be limited to, tape, polyethylene and vinyl; gloves; plastic vials; polystyrene; Tygon tubing; polyvinyl chloride plastic; Teflon products; Plexiglas; and dry box gloves (unleaded neoprene base). Cellulose-based waste includes, but may not be limited to, rags, wood, paper, cardboard, laboratory coats and coveralls, booties and cotton gloves, and similar materials. The waste stream may also contain a smaller fraction of non-combustible solids (e.g., scrap metal, crucibles, metal lids, zippers, discarded tools) and a small fraction of homogenous solids, salts, leached solids, ash, hydroxide cakes, crucibles, impure oxides.

Waste Stream Source Description N/A

Waste Stream Description Non-combustible and combustible waste generated from facility and equipment operations and maintenance. This waste includes, but may not be limited to, small tools, small equipment, cans, motors, pumps, process equipment, gloveboxes, ventilation ductwork, metal-based HEPA filters, pipes, glass, graphite, slag and crucibles, salt, discarded lab ware, windows, and bottles. The waste stream may also contain a smaller fraction of combustible solids (e.g., paper, rags, plastic, rubber, leaded gloves) and a small fraction of homogeneous solids (e.g., leached solids, ash, hydroxide cakes, impure oxides).

Waste Stream Source Description N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Combustible/noncombustible debris including paper, rags, plastic, rubber, and plastic-based and cellulose-based waste generated during 238Pu activities. Plastic-based waste includes, but may not be limited to: tape, polyethylene and vinyl; gloves; plastic vials, polystyrene; tygon tubing; polyvinyl chloride plastic; Teflon products; plexiglass; and dry box gloves (unleaded neoprene base). Cellulosebased waste includes, but may not be limited to: rags, wood, paper, and cardboard; laboratory coats and overalls; booties and cotton gloves, and similar materials. The waste may also contain HEPA filters, noncombustible glass and metallic debris. Some of this waste was packaged in small metal cans before being placed in 55 Gallon drums.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Combustible/noncombustible debris: heat source fabrication, 238Pu from SRS. Combustible/noncombustible debris including paper, rags, plastic, rubber, and plastic-based and cellulose-based waste generated during 238Pu activities. Plastic-based waste includes, but may not be limited to: tape, polyethylene and vinyl; gloves; plastic vials, polystyrene; tygon tubing; polyvinyl chloride plastic; Teflon products; plexiglass; and dry box gloves (unleaded neoprene base). Cellulosebased waste includes, but may not be limited to: rags, wood, paper, and cardboard; laboratory coats and overalls; booties and cotton gloves, and similar materials. The waste may also contain noncombustible glass and metallic debris. Some of this waste was packaged in small metal cans before being placed in 55 Gallon drums. This waste stream may contain lead items, or items from process status code R8, PPD, TDC (which may be mixed waste items).

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Noncombustible and combustible waste generated from facility and equipment operations and maintenance. This waste includes, but may not be limited to, small tools, small equipment, cans, motors, pumps, process equipment, gloveboxes, ventilation ductwork, metal-based HEPA filters, pipes, glass, graphite, slag and crucibles, salt, discarded lab ware, windows, and bottles. The waste stream may also contain a smaller fraction of combustible solids (e.g., paper, rags, plastic, rubber, leaded gloves) and a small fraction of homogeneous solids (e.g. leached solids, ash, hydroxide cakes, impure oxides).

Waste Stream Source Description N/A

Current Container Comments N/A

EPA Comments N/A

Management Comments Former WS IDs: LAM004, LAM005, LAM009, LAT004, LAT005, LAT009, also contains containers not previously associated with an identified BIR WS

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste consists mostly of untreated dry solids such as tissues, paper, assorted plastics, glassware, ceramics, and metals. Portland cement or Aquaset is used to solidify small amounts of water-based liquids; Envirostone or Petroset is used to solidify small amounts of solvents and oil-based liquids. The composition varies considerably, but it is predominantly organics (> 90% by weight). The waste does contain small amounts of RCRA listed hazardous materials. Typical hazardous materials are leaded gloves or materials contaminated with solvents.

Waste Stream Source Description Form 1 Mixed: The waste consists of glovebox bagout waste, laboratory trash and some contaminated equipment. The waste contains small amounts of RCRA materials such as solvents or lead shielding. The waste may occasionally include small quantities of solidified liquids, but these are usually segregated as waste form 2.

Current Container Comments N/A

EPA Comments Regulated contaminants reported are based on generator reports of laboratory experimental processes. This waste stream is included in LLNL's PSTP report of waste stream number LL-W018. That waste stream also included waste packages possibly, but not known to be contaminated with RCRA hazardous materials. More process knowledge and analysis will be done to further characterize those packages. Note that in this report (WTWBIR & MWIR), LL-W018 consists only of metal scrap waste, plus small amounts of laboratory trash, mostly in boxes, that is known to be mixed waste.

Management Comments Some waste may need to be repackaged in order to meet transportation (TRAMPAC) requirements for gas generation. I have not included in this waste stream any waste containing hazardous constituents that the state of California would regulate (more stringently than RCRA) if the waste were not also radioactive. California now has authority to regulate only RCRA mixed waste.

Acceptance Comments N/A

Final Form Comments Repackaging may be required due to approximately 50% of waste containers not meeting thermal power requirements of TRAMPAC; however I don't know how much repackaging will actually be required and how many extra drums would be generated thereby. Therefore, my estimates in 8.2.15 are the same as in 8.2.14. Date of inventory and number of containers projected are the same as storage container estimates.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	50 to 90% of this waste matrix consists of liquids solidified in 1 to 5 gallon plastic containers using Portland cement or Aquaset for the water based liquids and Envirostone or Petroset for the oil-based liquids. The remainder consists of glovebox waste similar to form 1 waste. The waste does not contain any RCRA-listed hazardous materials.
Waste Stream Source Description	Form 2 Non-mixed: More than 50 volume percent of this waste consists of solidified water-based or oil-based liquids or solidified fine particles. The remaining waste consists of glovebox bagout waste, laboratory trash and some contaminated equipment.
Current Container Comments	N/A
EPA Comments	N/A
Management Comments	Some waste may need to be repackaged in order to meet transportation (TRAMPAC) requirements for gas generation. This waste stream may contain waste containing hazardous constituents that the state of California would regulate (more stringently than RCRA) if the waste were not also radioactive. California now has authority to regulate only RCRA mixed waste.
Acceptance Comments	N/A
Final Form Comments	Date of inventory and number of containers projected are the same as storage container estimates.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste consists mostly of untreated dry solids such as tissues, paper, assorted plastics, glassware, ceramics, and metals. Portland cement or Aquaset is used to solidify small amounts of water-based liquids; Envirostone or Petroset is used to solidify small amounts of solvents and oil-based liquids. The composition varies considerably, but it is predominantly organics (> 90% by weight). The waste does not contain any RCRA listed hazardous materials.

Waste Stream Source Description Form 1 Non-Mixed: The waste consists of glovebox bagout waste, laboratory trash and some contaminated equipment. The waste may occasionally include small quantities of solidified liquids, but these are usually segregated as waste form 2.

Current Container Comments This container previously in LL-W031. Recategorized as a result of AK project.

EPA Comments N/A

Management Comments Some waste may need to be repackaged in order to meet transportation (TRAMPAC) requirements for gas generation. This waste stream may contain waste containing hazardous constituents that the state of California would regulate (more stringently than RCRA) if the waste were not also radioactive. California now has authority to regulate only RCRA mixed waste.

Acceptance Comments N/A

Final Form Comments Date of inventory and number of containers projected are the same as storage container estimates.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	The waste consists mostly of metal scrap such as decommissioned gloveboxes, hoods and other large equipment as well as laboratory trash. Typically it will contain metal components, glassware, ceramics, plastics, paper, and wood. It will be mostly inorganic materials, but can vary widely. This waste does not contain RCRA listed hazardous materials.
Waste Stream Source Description	Form 3 non-mixed: This waste consists of contaminated equipment and laboratory trash too big to fit in 55 gallon drums. This waste does not contain RCRA hazardous materials.
Current Container Comments	N/A
EPA Comments	N/A
Management Comments	Some waste may need to be repackaged in order to meet transportation (TRAMPAC) requirements for gas generation. This waste stream may contain waste containing hazardous constituents that the state of California would regulate (more stringently than RCRA) if the waste were not also radioactive. California now has authority to regulate only RCRA mixed waste.
Acceptance Comments	N/A
Final Form Comments	Average radionuclide content of final containers (SWBs) will depend on content of existing boxes to be repackaged and existing SWBs plus content of SWBs to be generated. Date of inventory and number of containers projected are the same as storage container estimates.

TWBIR ID: LL-T005

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	The waste matrix is mostly wood framed HEPA filters although some small metal cased HEPA filters are also included. Some of the filters contain asbestos.
Waste Stream Source Description	Form 5 non-mixed: HEPA filters
Current Container Comments	Contains nuclides submitted in MWIR/BIR, Rev. 1 data call in 1994, copy enclosed.
EPA Comments	Generator knowledge about old HEPA filters is largely lacking; however some of these filters are known to contain asbestos.
Management Comments	Some waste may need to be repackaged in order to meet transportation (TRAMPAC) requirements for gas generation. This waste stream may contain waste containing hazardous constituents that the state of California would regulate (more stringently than RCRA) if the waste were not also radioactive. California now has authority to regulate only RCRA mixed waste. Also, HEPA filters, if found to fail fine particles requirements, would require immobilization of fine particles.
Acceptance Comments	N/A
Final Form Comments	Date of inventory and number of containers projected are the same as Standard Waste Box storage estimates. However, I also project an extra 8 SWBs from repackaging the non-standard box. 8 Standard Waste Boxes will be required to repack the existing waste from the non-standard boxes and should be repackaged in the year 2000.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	The waste is potentially radioactive inorganic scrap metal generated from on-site laboratory research and maintenance, including laboratory clean up. Includes lead bricks and metal shavings. These materials may contain transuranic activity (80.6 lbs. in 55-gal. drum) Waste is used and discarded metal parts generated from on-site research and development activities.
Waste Stream Source Description	Form 3 mixed: This waste consists of contaminated equipment and laboratory trash too big to fit in 55 gallon drums. This waste does contain RCRA hazardous materials. Inorganic scrap metal generated from on-site laboratory research and maintenance, including laboratory clean up.
Current Container Comments	N/A
EPA Comments	Regulated contaminants reported are based on generator reports of laboratory experimental processes. This waste stream is included in LLNL's PSTP report of waste stream number LL-W018. That waste stream also included waste packages possibly, but not known to be contaminated with RCRA hazardous materials. More process knowledge and analysis will be done to further characterize those packages. Note that in this report (WTWBIR & MWIR), LL-W018 consists only of metal scrap waste, mostly in boxes, that is known to be mixed waste.
Management Comments	Some waste may need to be repackaged in order to meet transportation (TRAMPAC) requirements for gas generation. I have not included in this waste stream any waste containing hazardous constituents that the state of California would regulate (more stringently than RCRA) if the waste were not also radioactive. California now has authority to regulate only RCRA mixed waste.
Acceptance Comments	N/A
Final Form Comments	Date of inventory and number of containers projected are the same as storage container estimates.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	The waste is radioactive halogenated solvents generated from on-site cleaning of tanks and equipment and operating of research laboratories and machining shops. Waste consists of TCE and TCA and may contain transuranic activity (0.6 lbs. in a 55-gallon drum). Waste is generated from the on-site cleaning of tanks and equipment used in changing R & D activities.
Waste Stream Source Description	Form 2 Mixed: More than 50 volume percent of this waste consists of solidified water-based or oil-based liquids or solidified fine particles. The remaining waste consists of glovebox bagout waste, laboratory trash and some contaminated equipment.
Current Container Comments	N/A
EPA Comments	Regulated contaminants reported are based on generator reports of laboratory experimental processes. This waste stream is included in LLNL's PSTP report of waste stream number LL-W018. That waste stream also included waste packages possibly, but not known to be contaminated with RCRA hazardous materials. More process knowledge and analysis will be done to further characterize those packages. Note that in this report (WTWBIR & MWIR), LL-W018 consists only of metal scrap waste, plus small amounts of laboratory trash, mostly in boxes, that is known to be mixed waste.
Management Comments	Some waste may need to be repackaged in order to meet transportation (TRAMPAC) requirements for gas generation. I have not included in this waste stream any waste containing hazardous constituents that the state of California would regulate (more stringently than RCRA) if the waste were not also radioactive. California now has authority to regulate only RCRA mixed waste.
Acceptance Comments	N/A
Final Form Comments	Date of inventory and number of containers projected are the same as storage container estimates.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description MTRU Heterogeneous Debris. The radioactive wastes generated on the project will come first from normal operations and second from the D&D of the facility at the end of the project. Radioactive wastes from normal operation will consist of the following:

- o HEPA filters from the glove box
- o HEPA filters from offgas and room filtration systems
- o paper wipes from periodic cleaning of the glove boxes
- o used sample bottles
- o damaged glove box gloves
- o used crucibles, tubes, and wires

Waste Stream Source Description The radioactive wastes generated on the project will come first from normal operations and second from the D&D of the facility at the end of the project. Radioactive wastes from normal operation will consist of the following:

- o HEPA filters from the glove box
- o HEPA filters from offgas and room filtration systems
- o paper wipes from periodic cleaning of the glove boxes
- o used sample bottles
- o damaged glove box gloves
- o used crucibles, tubes, and wires \$ \$ Mixed TRU Waste

Current Container Comments N/A

EPA Comments Waste has not yet been characterized

Management Comments MURR, costar tower 5th level in containment.

Acceptance Comments GENERAAREA: MURR Alpha Room GENOPERATI: The TRUMP-S test program uses three glove boxes located in the Alpha Lab: the argon box, the air box, and the ICP box. The three boxes are equipped with various pieces of test equipment.

The argon box is used to conduct the electrochemical experiments that are the objective of the program. Actinide metals are unpacked in this box, subdivided, and repackaged. Chloride salts of the actinides are prepared here. Samples of the materials used in the experiments are obtained in the argon box for analysis. The argon box is frequently cleaned using paper wipes, which are packaged in small waste cans for disposal.

The air box is used to prepare aqueous samples for analysis in the ICP box. These samples are later prepared for recovery of the actinides by evaporating the water. Tantalum materials that have been used in the argon box are cleaned in the air box for later reuse in the electrochemical tests. The air box is also frequently cleaned using paper wipes and these are likewise placed in waste cans for disposal.

The ICP box is used to analyze the chemical composition of various aqueous samples. The nebulizer of the ICP unit is located within the ICP box to contain the analysis samples. The atmosphere within the ICP box is air.

Materials used in the actinide tests: Test materials, along with paper wipes and waste cans for cleanup, are passed into the argon box through a transfer port from the Alpha lab. The test materials include the following items:

- o Actinide and rare earth elements as metals and chlorides
- o Cadmium as both metal and chloride
- o Tantalum and alumina crucibles

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: **MU-W002**

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

- o Tantalum, iron, and silver wire
- o Chloride salts (Ag, Li, K)
- o Alumina and Pyrex tubing
- o Tantalum foil
- o Sample bottles
- o NAA samples returned for use

Some solid samples of test materials are removed from the argon box through the neutron activation analysis (NAA) sample station for neutron activation or gamma spectrometer analysis. All other exits from the argon box are to the air box. Samples for analysis in the ICP, crucibles containing mixtures of actinides along with salts and cadmium, used tantalum materials, broken or used Pyrex and alumina, wire (Ta, Fe, and Ag), damaged glove box gloves, and packaged wastes (paper wipes) are all transferred to the air box through an interconnecting transfer port. Tantalum materials are normally cleaned and reused in the electrochemistry tests a number of times before they are disposed of as waste.

Aqueous chemicals, water, and beakers are transferred into the air box from the Alpha Lab for preparing and handling aqueous samples. These samples are analyzed in the ICP box and then returned to the air box. The air box is also cleaned frequently with paper wipes, and these are packaged in waste cans for disposal. Materials that are removed during test operations from the air box are either actinide materials that are being sent to storage, or wastes that are placed in 55-gal drums. Actinide materials consist of original actinide metal, crucibles containing actinides, salt, and cadmium metal, sample residue (oxides and chlorides remaining from aqueous samples), and NAA samples. Actinide materials are routinely removed from the glove boxes and returned to storage in sealed storage containers. The wastes removed from the air box will be used HEPA filters and refuse packaged in waste cans. Items removed from the air box are sealed in plastic bags as they exit the transfer port into the Alpha Lab. RECLASS_CO: classification of MURR waste is not complete CATION: NA WASTE_PACK: 55-gallon drums

Waste Stream Description This waste stream consists of glovebox parts, laboratory trash, contaminated equipment and solidified sludges. Real time radiography has been performed on the waste to verify that there are no free liquids present, with the exception of liquid in aerosol cans, which, when treated will be eliminated from this waste stream. Most of the waste is contact-handled TRU waste; 3 drums are remote-handled.* The waste stream was generated at the Lawrence Livermore National Laboratory, Livermore, CA (LLNL) and shipped to the NTS from 1974 until 1990. The waste was declared as potentially mixed TRU waste by the generator in April, 1991.

*Due to recent storage reconfigurations and surveys, only three of the 4 previously reported packages are considered remote-handled.

Waste Stream Source Description NTS STORED, TRU WASTE FROM LLNL
This waste stream, consisting of glovebox parts, laboratory trash, contaminated equipment, and solidified sludges, was generated from operations activities conducted at LLNL Buildings 251, 332, and 419. Actual activities and processes conducted to generate this waste stream are unknown.

Current Container Comments Currently, all 55-gal. drums are overpacked within 85-gal. vented drums.

EPA Comments Regulated contaminant information is based on process knowledge. No sampling of waste constituents has been conducted to date.

Management Comments The Nevada Test Site (NTS) is located about 105 km (65 mi) northwest of Las Vegas, and occupies 3,497 km² (1,350 mi²) of federally owned land in southeastern Nevada's Nye County. The Area 5 Radioactive Waste Management Site (RWMS) is located in Frenchman Flat within the southeast corner of the NTS, approximately 15 miles north of Mercury, Nevada and 80 miles northwest of Las Vegas, Nevada. The developed portion of the Area 5 RWMS occupies 37 hectares (ha) (92 acres) in the southeast corner of the 296 ha (732 acres) designated area of NTS Area 5. Building 5-24, a 21,470 square-foot fabric-covered structure, is located within the 92-acre RWMS on the TRU Waste Storage Pad, an asphalt pad comprising an area of 0.829 ha (2.05 acres) constructed to meet RCRA standards.

TWBIR ID: NT-W001

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Acceptance Comments The majority of this waste inventory was packaged before RCRA characterization requirements were imposed. Lawrence Livermore National Laboratory (LLNL) (the generator) declared the inventory to be "mixed" in April 1991. EPA Codes were estimated on the basis of TRU waste assessments and other information provided by the generator. The actual waste matrix and contaminant parameters will be further defined during future waste characterization and certification activities for the express purpose of certifying the waste to meet TRUPACT transport and WIPP disposal requirements.**This TRU waste inventory originated from LLNL/ Bldg. 251, LLNL/Bldg. 332, and LLNL/Bldg. 419; contact: Kem Hainebach, LLNL, (510) 422-4572. LLNL/Bldg. 251 generated TRU waste containing debris potentially contaminated with the following RCRA solvents and acids: nitric acid dried on Kimwipes (ignitable) (EPA code D001), and RCRA metals cadmium in "silver" solder (EPA code D006) and lead (EPA code D008).**LLNL/Bldg. 332 generated TRU waste debris potentially contaminated with: carbon tetrachloride (CC1-4) on Kimwipes (F001), ethyl alcohol (D001), freon TF on cotton wipes and Kimwipes (F001), methanol on Kimwipes (F003), nitric acid (D002, and if >45%, an oxidizer (D001), nitric acid on Kimwipes (ignitable) (D001), trichloroethylene (TCE) (F001), varnish and paints (D001); RCRA metals calcium (D003), and lead (D008); and the following CA hazardous wastes: beryllium, sometimes as flakes, (CA code 181), cerium (CA 181), copper (CA 181), copper shavings (CA 181), gallium (CA 181), Invoil-42 (an oil, potentially CA hazardous) (CA 352), kerosene (an oil, potentially CA hazardous) (CA 352), magnesium powder (CA 181), oil and oily rags (CA 352), and yttrium oxide (CA 181). LLNL /Bldg. 419: TRU waste debris potentially contaminated with: trichloroethylene (TCE) (F001), and CA hazardous waste oil (California code 352).**Past assay efforts resulted in undetermined final numbers on gram content; re-assay to be conducted.**It has been established that the bulk of the TRU mixed wastes stored at the Area 5 RWMS were placed into storage prior to the effective date of the LDR prohibitions applicable to solvent waste and that any attempt to move the wastes to another facility would trigger LDR requirements. Mixed wastes stored prior to the effective date of applicable LDR requirements "are not subject to the LDR storage prohibition as long as they are not removed from storage or otherwise actively managed while in storage." (57 Federal Register 22024, 22041 [05-26-92]).**The management of the Area 5 RWMS TRU mixed waste inventory is governed by a Settlement Agreement between the state of Nevada and DOE/NV. The TRU mixed waste shall remain in storage until such time that EPA issues a no-migration variance to WIPP, after the test phase, or when suitable treatment capacity is developed with which to treat the wastes. The TRU mixed waste is contained in 1636 0.208 m3 (55-gallon) steel drums and 58 steel boxes of various sizes. The 55-gallon drums are overpacked in 0.321 m3 (85-gallon) DOT Type A drums which are vented with carbon-composite filters. The inventory also includes one 0.321 m3 (85-gallon) drum which is vented with a carbon-composite filter. The containers are stored on pallets inside the TRU Cover Building 5-24. The drums are triple-stacked and boxes double-stacked. Three-foot aiseways between container rows provide for routine RCRA inspections, and 4-foot fire aisles are located at all four personnel exits.** Lead may have been used as shielding inside some containers. Liquids are solidified in individual one-gallon, metal paint can containers which are then placed in 55-gallon drums, although several containers were found to contain small amounts of free liquids (via RTR). Boxed waste includes decommissioned glove boxes, hoods, and large pieces of contaminated equipment. Combustibles (tissues, paper, assorted plastics, and bagging) fill the void spaces in both boxes and drums. Most boxes have permanent skids, but all are stored on pallets. A standard eight-ton forklift is used to shuttle the boxes, and a drum-handler is attached to the fork tines to shuttle drums.

Final Form Comments No TRU standard waste boxes (SWBs) are currently in storage at NTS. However, current storage numbers are representative of the assumption that 143 SWBs will be required to repack all 58 nonstandard boxes. Projections include 2 SWBs from decon activities.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The two steel vessels are 1-inch thick by 3-feet diameter, weighing about 2700 lbs. each. The vessels contain heterogeneous mixtures of the following materials: Plutonium, D-38, Beryllium metal, Completely burned high explosive, Stainless steel, Brass, Polystyrene foam, Aluminum, Coke (degassed coal), Water absorbed by the coke, Steel, Glass, Epoxy resin, Thermalite (aerated cement block), Plaster, Hortag (fly-ash and clay), Wood, and Krypton-85 tracer gas for leak detection. The UK has had similar vessels in storage for over ten years, but none containing plutonium have ever been opened. Vessels containing D-38 only have been opened, with small amounts of water vapor and some loose debris found inside. The bulk of the materials were found to be trapped within the thick coke layer lining the inner surface of the vessel. No more wastes of this type are planned to be generated.

Waste Stream Source Description This is a "one-time" generated TRU waste stream, resulting from joint US/UK tests conducted in the United Kingdom. Each vessel is a 3-foot diameter sphere, weighing about 2700 pounds. High explosives were detonated inside the vessel chamber, resulting in a concrete-like, heterogeneous substance made up of Pu, depleted uranium, beryllium, pulverized coke, glass, wood, steel, and aluminum debris.

Current Container Comments N/A

EPA Comments This waste stream is not "mixed."

Management Comments N/A

Acceptance Comments Previously, LLNL had inquired about having an exemption from WIPP WAC issued for this waste stream. Per correspondence from Arlen Hunt (ALO/WIPP) to Daniel Nakahara (DOE/SAN) [memo TSIT:HJD 90-0049, "TRU Material Above WIPP-WAC Safety Limits", March 6, 1990], the Waste Acceptance Criteria Certification Committee could not determine "if these containers will ever qualify for disposal at WIPP." Until such time that an alternative disposal site is made available, or exemption from the WIPP-WAC is received, this waste stream will remain in safe storage at the NTS.

Final Form Comments Internal volume of SWB is assumed to be 1.89 cubic meters; total waste stream volume (external) estimated at 5.678 cu. m., divided by 1.89 = 3 SWBs. Plastic bagging would be used to contain any contamination. This also assumes, although highly unlikely, that the vessels are size-reduced to fit inside SWBs, as opposed to being shipped within TDOPs. Considering FGE within each vessel, two TDOPs could probably be used for shipping this waste stream to WIPP.

Waste Stream Description Waste is treated stream from a mixture from the Melton Valley Storage Tanks (MVST), MVST, Capacity Increase Project Tanks, and Bethel Valley Evaporator Storage Tanks. Waste from the Old Hydrofracture (OHF) and Gunite and Associated Tanks (GAAT) was previously mixed into the MVST. Additional input of 37Kg of U233 from ER waste stream.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	This waste stream is a solid cemented sludge. It could have small amounts of free liquids in the bottom of the container.
Waste Stream Source Description	<p>Aqueous sludge wastes assigned IDCs 001 and 800 were generated by the high-level aqueous waste treatment system in Building 774. IDC 001 was replaced by IDC 800 in 1986.</p> <p>A two-stage basic waste treatment, precipitation, and filtration process generates IDCs 001 and 800 aqueous sludge. Acidic wastes are neutralized with sodium hydroxide in stage one. Ferric sulfate and Purifloc flocculant are added to the neutralized waste (containing metal ions) to precipitate the sludge prior to filtration. In stage two, ferric sulfate, magnesium sulfate, calcium chloride, and Purifloc flocculant are added to basic wastes during the two-stage treatment to precipitate sludge. The sludge slurry from the acidic and basic waste treatment is drawn through a diatomite filter media on a rotating drum filter to trap the solids. The filter media and sludge are continuously scraped off the drum filter and co-fed into a 55-gallon drum with additional diatomite and Portland cement making up the solidification process. No mechanical mixing of the sludge and cement is performed.</p> <p>Prior to 1979, IDC 001 consisted of sludge from the first-stage treatment only. When the first- and second-stage sludges were packaged separately, two vacuum filters were used. From 1979 to 1986, IDC 001 was a combination of the sludges from the first- and second-stage treatment processes. The sludge was produced chemically in the same fashion aqueous waste was treated to produce IDC 800 sludge. The solidification process for IDC 001 differs from the IDC 800 method of adding cement and diatomite as the sludge collects. Portland cement was added to the bottom of the IDC 001 drum prior to placing the sludge in the drum. In some cases additional Portland cement was added on top of the sludge.</p> <p>Prior to September 1984, Building 774 accepted many aqueous process wastes from other buildings. These wastes, now piped to Building 374, were treated as described above. The accepted wastes included aqueous waste from Buildings 122, 123, 444, 559, 707, 776, 778, 779, 865, 881, 883, 889. After August 1984 and the start-up of the Building 374 Precipitation Process, only waste piped from Building 771 (stream condensate, scrubber waste, ion column effluent, and process waste sinks), waste in containers from various buildings, and wastes generated within Building 774 (silver recovery effluent, seal liquid, and floor washdown) were accepted. From 1986 through 1989, the treatment process treated from 150,000 gallons to over 500,000 gallons per year and generated 2,700 drums of IDCs and 800 sludge.</p> <p>See Solidified Bypass Sludge/LLM for detailed descriptions of IDCs 007, 803, and 807.</p>
Current Container Comments	N/A
EPA Comments	<p>According to the Building 774 Second-Stage Treatment Log (January 1981 to October 1989), prior to September 1984, the Building 774 aqueous waste treatment system received waste streams that are treated in the Building 374 Liquid Waste Treatment Facility. These streams affected the characterization of Building 774 solidified sludge until September 1985. The choice of the transition date of September 1984 is discussed in detail under the Subpopulation 55A discussion in the Backlog Baseline Book prepared by Rocky Flats.</p> <p>Information contained in the November 1992 WSRIC Valve Vaults Book has been used to characterize waste streams treated in Building 774 prior to September 1984. The Valve Vaults book describes the process waste sent to Building 374 for treatment. The book was used because it is the only reference that provides detailed characterization information on waste that was sent to Building 774. Other references and interviews have been used to enhance or add to this information as it relates to the waste form.</p>
Management Comments	N/A
Acceptance Comments	RFP has assumed this waste to be LDR based on process knowledge characterization and limited analytical data.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream consists of a cemented solid, with some free liquids. It can also have some small chunks in it.

Waste Stream Source Description Solidified organics are cemented waste oils and solvents that were generated as a result of machining and tool degreasing. Waste oil was transferred primarily from Buildings 707 and 777. Cementation was performed in Waste Management Unit (WMU) 56, Room 210, Building 774. The earliest generation date for the backlog inventory is June 1984. The Organic and Sludge Immobilization System (OASIS) Process generating solidified organics stopped in January 1990. These containers are assigned IDC 0003 and 0801.

Solidified organics waste currently stored at Rocky Flats was generated by the Grease Plant Process or the OASIS Process. The Grease Plant Process operated until November 1985. The OASIS Process began operating in November 1985. The last OASIS runs occurred in 1991.

Tanks T-1 and T-2, Tank T-374A, and Tanks T-13 and T-14 have all received waste oils and solvents for treatment at various times. The waste oils and solvents were generated primarily by processes in Buildings 707 and 777. Solvent-contaminated waste oils were generated by plutonium machining and tool degreasing. Ultrasonic cleaners consisting of trichloroethane baths were used to clean parts. Buildings 707 and 777 also cleaned metal turnings and scrap in carbon tetrachloride baths before forming them into briquettes.

Laboratory wastes in bottles were poured into containers of solidified organics in the past. Laboratory waste contaminants included organophosphates and nitrobenzene. According to the generator, bottled laboratory wastes were poured into five or fewer solidified organics containers. However, there is no documentation specifying the individual drums.

The majority of wastes fed to the solidified organics generation processes consisted of plutonium-contaminated oils and solvents. A cutting oil, usually Texaco Regal "A," flowed onto a part during machining. After machining, the part was rinsed to remove residual oil. Various solvents were used to rinse machined parts and degrease tools. These included trichloroethylene and tetrachloroethylene. According to the generator, trichloroethylene and tetrachloroethylene use stopped in 1973.

Spent carbon tetrachloride and trichloroethane from cleaning baths were also fed to the solidified organics generation processes. Parts for assembly from Buildings 707 and 777 were cleaned in ultrasonic wash tanks before welding. The tanks contained 15 gallons of trichloroethane. In another cleaning process, metal turnings and scraps were placed into perforated metal baskets and dipped into a series of tanks containing carbon tetrachloride. Each of the steel tanks held 4 gallons of solvent. The cleaned metal was then formed into briquettes. Carbon tetrachloride and trichloroethane baths were replaced periodically.

Waste oil and solvents were drained and pumped into storage tanks. The wastes were then filtered to recover the actinides. After filtering, the plutonium and uranium concentrations in the waste were measured. If the concentrations were above specified transfer limits, the waste was refiltered in the Ful-Flo filtration system. When the concentrations of plutonium and uranium were below transfer limits, the waste was transferred to the solidified organics generation processes in Building 774.

Tanks T-1 and T-2, Tank T-374A, and Tanks T-13 and T-14 received waste oils from the same processes in Buildings 707 and 777. Tanks T-1 and T-2 fed waste oils to the Grease Plant Process and the OASIS Process. Tank T-374A began feeding waste oils to the OASIS Process after damage to Tanks T-1 and T-2 was identified and they were removed from operation. Tanks T-13 and T-14 began feeding waste oils after Tank T-374A. Tanks T-374A, T-13, and T-14 were used simultaneously until Tank T-374A was removed from operation. Tanks T-13 and T-14 continued feeding the OASIS Process until it stopped in January 1990.

In the Grease Plant Process, waste oil and Microcel E (calcium silicate) were fed separately into a continuous mixer. Small amounts of Oil Dri were sometimes added to the mixture as well. The amounts of materials added to the mixture were not metered. However, the operator would adjust the composition if the outgoing mixture did not have a paste-like consistency. The mixture would then drop into an O-ring bag contained in a 55-gallon drum. Drums of solidified organics from the Grease Plant Process were subsequently transported to the Size Reduction Facility in Building 776 for inspection and sealing.

OASIS was a batch-type process generating one drum per run. Waste oils were pumped into an O-ring bag contained in a 55-gallon drum attached to the

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT0003

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

bottom of the OASIS glovebox. Envirostone emulsifier, gypsum cement, and accelerator were also metered into the bag. House water, which had not been used in any other processes, was added to the mixture as well. A Lightning Mixer was lowered into the drum after all of the materials were added. The amount of materials added to the mixture was operator controlled.

The drums were transferred to WMU 73, Room 241, after they had been inspected and sealed. Solidified organics containers from the OASIS process were stored in Building 774 until they were transferred to Building 371 for nondestructive assay (NDA). After RTR, drums were usually sent to Building 664, where they were stored until shipment off site. Solidified organics waste is not being shipped at this time. Consequently, Building 664 has reached capacity and solidified organics are also being stored in Buildings 371, 569, 774, and 776.

Current Container Comments N/A

EPA Comments Solidified organics were generated by the OASIS process after November 11, 1985.

Analytical information regarding solidified organics was not found in the WSRIC Sampling and Analysis database. However, non-WSRIC analytical data from 1988 and 1989 are considered in the characterization of the waste. The analytical method was not specified for the results. However, Toxicity Characteristic Leaching Procedure (TCLP) analysis was not typically performed in 1988 and 1989. The results are assumed to be from Totals analysis. Validated headspace analysis performed on drums containing solidified organics are considered as well. Headspace analytical results support the 1988 and 1989 results from sampling and analysis.

Wastes received by Tanks T-1 and T-2, T-374A, and T-13 and T-14 were intermittently contaminated with Resource Conservation and Recovery Act (RCRA) organics. Carbon tetrachloride (D019), nitrobenzene (D036), and trichloroethylene (D040) were cited contaminants. Nitrobenzene was a contaminant in nonroutine laboratory waste and was introduced into five or fewer drums. Contaminated drums could not be identified. However, the solidified organics population, as a whole, does not exhibit the toxicity characteristic for nitrobenzene.

Sampling and analysis of three solidified organics samples in 1988 and 1989 indicated the waste exceeded toxicity characteristic criteria for carbon tetrachloride (EPA Code D019). The waste did not exceed toxicity characteristic criteria for any of the other cited RCRA organics. TCLP analysis of the waste under EPA SW-846 is required to support the analytical results and confirm the assumptions.

Based on the "mixture" rule and the "derived-from" rule, solidified organics would carry the listed EPA codes associated with the wastes fed to the solidified organics generation processes. EPA Codes F001 and F002 are assigned to all solidified organics because wastes received by Tanks T-1 and T-2, T-374A, and T-13 and T-14 were contaminated with regulated spent solvents in the past.

Sampling and analysis of solidified organics waste in 1988 and 1989 indicated the waste exceeded the F001 and F002 LDR treatment standards for carbon tetrachloride and 1,1,1-trichloroethane. The analyses found detectable concentrations of other F001 and F002 constituents, as well. Total analysis of the waste under EPA SW-846 is required to confirm these results.

P- and U-listed EPA codes for discarded commercial chemical products will not be assigned to solidified organics. Excess chemicals are stored on the plant site. However, there is no documentation supporting P- and U-listed waste codes for specific chemicals that were disposed of in process waste. Cited laboratory chemicals like nitrobenzene were used for their intended purpose as reagents and were not discarded commercial chemical products.

Management Comments N/A

Acceptance Comments RFP has assumed this waste to be LDR based on process knowledge characterization, and one sample analyzed for volatiles in 1988.

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. The waste is stored in 55-gallon carbon steel drums with a rigid polyethylene liner and one or two bag liners.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is a solid cemented sludge. It could have small amounts of free liquids in the bottom of the container.

Waste Stream Source Description Aqueous sludge wastes assigned IDCs 001 and 800 were generated by the high-level aqueous waste treatment system in Building 774. IDC 001 was replaced by IDC 800 in 1986.

A two-stage basic waste treatment, precipitation, and filtration process generates IDCs 001 and 800 aqueous sludge. Acidic wastes are neutralized with sodium hydroxide in stage one. Ferric sulfate and Purifloc flocculant are added to the neutralized waste (containing metal ions) to precipitate the sludge prior to filtration. In stage two, ferric sulfate, magnesium sulfate, calcium chloride, and Purifloc flocculant are added to basic wastes during the two-stage treatment to precipitate sludge. The sludge slurry from the acidic and basic waste treatment is drawn through a diatomite filter media on a rotating drum filter to trap the solids. The filter media and sludge are continuously scraped off the drum filter and co-fed into a 55-gallon drum with additional diatomite and Portland cement making up the solidification process. No mechanical mixing of the sludge and cement is performed.

Prior to 1979, IDC 001 consisted of sludge from the first-stage treatment only. When the first- and second-stage sludges were packaged separately, two vacuum filters were used. From 1979 to 1986, IDC 001 was a combination of the sludges from the first- and second-stage treatment processes. The sludge was produced chemically in the same fashion aqueous waste was treated to produce IDC 800 sludge. The solidification process for IDC 001 differs from the IDC 800 method of adding cement and diatomite as the sludge collects. Portland cement was added to the bottom of the IDC 001 drum prior to placing the sludge in the drum. In some cases additional Portland cement was added on top of the sludge.

Prior to September 1984, Building 774 accepted many aqueous process wastes from other buildings. These wastes, now piped to Building 374, were treated as described above. The accepted wastes included aqueous waste from Buildings 122, 123, 444, 559, 707, 776, 778, 779, 865, 881, 883, 889. After August 1984 and the start-up of the Building 374 Precipitation Process, only waste piped from Building 771 (stream condensate, scrubber waste, ion column effluent, and process waste sinks), waste in containers from various buildings, and wastes generated within Building 774 (silver recovery effluent, seal liquid, and floor washdown) were accepted. From 1986 through 1989, the treatment process treated from 150,000 gallons to over 500,000 gallons per year and generated 2,700 drums of IDCs and 800 sludge.

See Solidified Bypass Sludge/LLM for detailed descriptions of IDCs 007, 803, and 807.

Current Container Comments N/A

EPA Comments All waste with D001, D002, and D003 codes will be processed or repackaged prior to shipment to WIPP per Geoff Asmus. According to the Building 774 Second-Stage Treatment Log (January 1981 to October 1989), prior to September 1984, the Building 774 aqueous waste treatment system received waste streams that are treated in the Building 374 Liquid Waste Treatment Facility. These streams affected the characterization of Building 774 solidified sludge until September 1985. The choice of the transition date of September 1984 is discussed in detail under the Subpopulation 55A discussion in the Backlog Baseline Book prepared by Rocky Flats.

Information contained in the November 1992 WSRIC Valve Vaults Book has been used to characterize waste streams treated in Building 774 prior to September 1984. The Valve Vaults book describes the process waste sent to Building 374 for treatment. The book was used because it is the only reference that provides detailed characterization information on waste that was sent to Building 774. Other references and interviews have been used to enhance or add to this information as it relates to the waste form.

Management Comments N/A

Acceptance Comments RFP has assumed this waste to be LDR based on process knowledge characterization and limited analytical data.

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT0007

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. WASTE_PACK: Waste is packaged in 55 gallon DOT 7A Type A Drums. The drums are lined with one rigid polyethylene liner and two bag liners.

Final Form Comments N/A

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists of sludge type material. It is a semi-fluid material. Some of it has had cement added to it to try to solidify it.

Waste Stream Source Description Item Description Code 292-Incinerator Sludge

IDC 292 was intended for incinerator sludge from the recovery incinerator in Building 771. IDC 292 materials were reassessed under Waste Form 1, Incinerator Ash. However, there is one box WEMS incorrectly assigned this IDC. According to the waste-box log sheet dated October 14, 1987, the box contains Electrochemical Milling Sludge generated in Building 881. This operation generated sludge from the milling of various metals including stainless steel. It was indicated that no cyanides were used in the ECM operations in Building 881. The IDC for this box should be changed to 299.

Item Description Code 299-Miscellaneous Sludge

This IDC has been used for sludges that were not accurately categorized as IDC 290 or 340 and could have been generated in any plutonium processing building. However, the backlog miscellaneous sludge was generated in Building 771 during the processing of residues, in Building 371 in the analytical laboratory, and in Building 883 by the Rolling Process. Process pipe sludge, sludge dissolution heel, and filter plenum sludge from Building 771 were processed through nitric acid dissolution and sparging. Soil and sludge samples from around the site were analyzed in Building 371, and the waste was stored for processing. IDC 299 materials generated in Building 883 include quench sludge and uranium oxide sludge from the Rolling Process. This group also includes one container of electrochemical milling sludge generated in Building 881 in October 1987. The container is assigned IDC 292.

Item Description Code 372-Grit

This IDC was generated by grit blasting operations in Building 371 (primarily for cleaning steel and iron) and Building 777 in the Machining and Coating processes (primarily cleaning shields). A variety of materials were used for the grit, including iron shot, walnut shells, glass beads, and ceramic beads. The majority of the grit is thought to be iron shot ranging in size from fines to irregular particles. There were apparently no other RCRA-regulated metals involved in the grit blasting. There is one drum of IDC 372 shown in WEMS as being generated in Building 371. However, no grit blasting operation could be identified in that building.

Item Description Code 823-Cemented Sludge

IDC 823, cemented miscellaneous sludge, was generated when sludge designated as inorganic particulate and sludgy material that was below the economic discard limit (EDL) was placed in 1-gallon paint cans and covered with Portland cement or mixed with cement into a block. The first scenario was conducted in Building 771 and the second in Building 371. This could have included IDCs 290-299 and was done to meet the Waste Isolation Pilot Plant (WIPP) waste acceptance criteria. The material came primarily from Nash pumps in Building 771 and included vacuum grease and oily sludge. One drum of the material was apparently generated when the pit in front of Building 707 was cleaned out. However, the contents of the pit sludge could not be ascertained. One drum was generated in the Size Reduction Vault in Building 776. Six drums were generated in Building 774 and are stored in Building 371. Drum-specific information was requested but was not received. The drums from Building 559 are incorrectly assigned IDC 823 in WEMS. The drums are stored in Building 771 and are labeled with IDC 863. It appears that IDC 823 was entered incorrectly in WEMS. Therefore, these drums should be changed to IDC 863 in WEMS.

This waste form is generated from Facility/Equipment Operation, Maintenance, Analytical Laboratories, R&D Laboratories, D&D, and limited Emergency Response actions.

Current Container Comments N/A

EPA Comments All waste with D001, D002, and D003 codes will be processed or repackaged prior to shipment to WIPP per Geoff Asmus. Subpopulation 1B consists of approximately 85, IDC 292 incinerator sludge containers. EPA Codes D002, D004-D011, F001, F002, F003, and F005 were assigned to this subpopulation based on the characterization of incinerator feed materials. Based on the characterization of the feed, alcohols, glycols,

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT-0292

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

halogenated solvents, and metals may have been introduced into the incinerator. Because the specific sources of the incinerator feed cannot be determined at this time, it has been assumed that the process could have accepted any of the combustible, plastic, or filter wastes currently contained in the inventory that were generated during the time the incinerator was operational.

Management Comments N/A

Acceptance Comments

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. WASTE_PACK: The waste is packaged in 55-gallon drums with multiple bag liners. These are typically smaller containers within the drums.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists of sludge type material. It is a semi-fluid material. Some of it has had cement added to it to try to solidify it.

Waste Stream Source Description Item Description Code 292-Incinerator Sludge

IDC 292 was intended for incinerator sludge from the recovery incinerator in Building 771. IDC 292 materials were reassessed under Waste Form 1, Incinerator Ash. However, there is one box WEMS incorrectly assigned this IDC. According to the waste-box log sheet dated October 14, 1987, the box contains Electrochemical Milling Sludge generated in Building 881. This operation generated sludge from the milling of various metals including stainless steel. It was indicated that no cyanides were used in the ECM operations in Building 881. The IDC for this box should be changed to 299.

Item Description Code 299-Miscellaneous Sludge

This IDC has been used for sludges that were not accurately categorized as IDC 290 or 340 and could have been generated in any plutonium processing building. However, the backlog miscellaneous sludge was generated in Building 771 during the processing of residues, in Building 371 in the analytical laboratory, and in Building 883 by the Rolling Process. Process pipe sludge, sludge dissolution heel, and filter plenum sludge from Building 771 were processed through nitric acid dissolution and sparging. Soil and sludge samples from around the site were analyzed in Building 371, and the waste was stored for processing. IDC 299 materials generated in Building 883 include quench sludge and uranium oxide sludge from the Rolling Process. This group also includes one container of electrochemical milling sludge generated in Building 881 in October 1987. The container is assigned IDC 292.

Item Description Code 372-Grit

This IDC was generated by grit blasting operations in Building 371 (primarily for cleaning steel and iron) and Building 777 in the Machining and Coating processes (primarily cleaning shields). A variety of materials were used for the grit, including iron shot, walnut shells, glass beads, and ceramic beads. The majority of the grit is thought to be iron shot ranging in size from fines to irregular particles. There were apparently no other RCRA-regulated metals involved in the grit blasting. There is one drum of IDC 372 shown in WEMS as being generated in Building 371. However, no grit blasting operation could be identified in that building.

Item Description Code 823-Cemented Sludge

IDC 823, cemented miscellaneous sludge, was generated when sludge designated as inorganic particulate and sludgy material that was below the economic discard limit (EDL) was placed in 1-gallon paint cans and covered with Portland cement or mixed with cement into a block. The first scenario was conducted in Building 771 and the second in Building 371. This could have included IDCs 290-299 and was done to meet the Waste Isolation Pilot Plant (WIPP) waste acceptance criteria. The material came primarily from Nash pumps in Building 771 and included vacuum grease and oily sludge. One drum of the material was apparently generated when the pit in front of Building 707 was cleaned out. However, the contents of the pit sludge could not be ascertained. One drum was generated in the Size Reduction Vault in Building 776. Six drums were generated in Building 774 and are stored in Building 371. Drum-specific information was requested but was not received. The drums from Building 559 are incorrectly assigned IDC 823 in WEMS. The drums are stored in Building 771 and are labeled with IDC 863. It appears that IDC 823 was entered incorrectly in WEMS. Therefore, these drums should be changed to IDC 863 in WEMS.

This waste form is generated from Facility/Equipment Operation, Maintenance, Analytical Laboratories, R&D Laboratories, D&D, and limited Emergency Response actions.

Current Container Comments N/A

EPA Comments Subpopulation 46GA includes 15 containers generated in the Building 371 analytical labs. The WSRIC book for the building includes no IDC 299 waste streams. Until shortly after September 1993, the WSRIC book for Building 371 included a process output numbered 371-4-18 (Low-level Soil Sludges) that was assigned EPA Codes D002-D011, D018, D019, D035, D040, F001, F002, F005-F007, and F009. The current WSRIC book for Building 371 includes a new

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT-0299

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

stream, 371-4-22 (Low-Level Soil Sludges), that replaced number 371-4-18, and that is characterized only as characteristic waste with EPA Waste Codes D004-D011. The WEMS characterization for this group is D007. It is assumed, therefore, that since the containers in this group were generated from 1984 to 1992, the materials are best assigned the same waste codes as the 371-4-18 stream cited above, with the exception of the plating waste codes (F006, F007, and F009), and the reactivity code (D003), because it is known that no plating waste was generated in Building 371 labs and that no reactive wastes were generated. Most likely, all 15 containers do not contain wastes that are assigned all of the codes. It is also possible that some of the remaining waste codes can be removed based on EPA guidance concerning the sample exclusion cited in Section 261.4 (d). However, it could not be determined from personnel in Building 371 whether waste stream 371-4-18 was characterized as toxic for benzene (D018), carbon tetrachloride (D019), methyl ethyl ketone (D035), and trichloroethylene (D040) based on the double listing policy previously used or if the codes were assigned because the waste actually exhibits the characteristic of toxicity for those organics. Nor could it be confirmed whether the F-listed solvent codes were assigned because the lab felt it was generating listed solvent waste or if the codes were assigned because the lab was analyzing the F-listed solvent waste. Therefore, until these issues can be resolved, this subpopulation is characterized as hazardous and assigned EPA Waste Codes D002, D004-D011, D018, D019, D035, D040, F002, and F005. These containers should be analyzed unless data exist that can confirm or refute this characterization. The containers are all LDR regulated.

Subpopulation 46GB includes 11 containers generated in miscellaneous residue processing. All drums are characterized as hazardous and assigned EPA Waste Code D007 (chromium) in WEMS. The WSRIC book dated September 1993 includes process outputs numbered 771-12-14, 771-12-16, and 771-27-7, sludge dissolution heel, pipe sludge, and filter plenum sludge, respectively. These WSRIC outputs were generated by the Miscellaneous Residue Processing and Plenums processes. The sludges generated by residue processing are characterized as D007 wastes because the corrosive liquids the sludges came from leached chromium from the insides of stainless-steel transfer lines. The plenum sludge is characterized as nonhazardous. According to NMC, these streams were being generated during the period from 1984 to 1989, which would coincide with dates of generation for Subpopulation GB. According to NMC, the drums of IDC 299 were most likely generated by the residue processing operation. Therefore, the group is characterized as hazardous and assigned waste code D007 until analytical data are collected that prove otherwise. The containers are also LDR regulated.

Management Comments N/A

Acceptance Comments

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. WASTE_PACK: The waste is packaged in 55-gallon drums with multiple bag liners. These are typically smaller containers within the drums.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	IDC 320 - Scrap metals which are heavier than iron and steel. Metal above Cu on the periodic table. Mainly used tantalum crucibles.
Waste Stream Source Description	<p>Heavy metals have been produced as by-products of Rocky Flats operations in Buildings 371, 707, 771, 776, 777, 779, and 865; they are identified by IDC 320. The IDC 320 heavy nonspecial source metal was generated in various locations throughout the Rocky Flats and is stored in Resource Conservation and Recovery Act (RCRA) Units 11, 12, 13, 15A, and 20. This IDC includes nonstainless-steel metals that are heavier than iron. Examples of this waste include crucibles, funnels, rods, and process fixtures. These items are made primarily from tantalum, tungsten, and platinum, but some parts could have been manufactured or contaminated with lead if the accumulation start date was prior to 1987. IDC 320 originally included lead.</p> <p>During maintenance operations, the maintenance shop in Building 371 generated heavy metal vessels, instruments, rods, and plates fabricated from tantalum, tungsten, and platinum. The shop generated these items during 4 1/2 years of operation from 1983 until 1988. Of these containers in storage, 19 backlog containers have an EPA Code of D008 (lead); eight of these were produced after 1987. Building 707, Modules A and J, generated heavy metals in its foundry operations. These heavy metals were primarily crucibles and pans used for presampling. These processes generated material during 6 1/2 years of operation from 1985 until 1991. Nine backlog containers have an EPA Code of D008 (lead). The plutonium recovery operations in Building 771 generated leached Oralloid parts consisting of tantalum, tungsten, and platinum. The system generated material during 3 years of operation from 1987 until 1990. Five backlog containers have an EPA Code of D008 (lead); four of these backlog containers were produced after 1987. Building 776, Pyrochemical Processing, generated material during almost three years of operation from 1988 until 1990. This material consists primarily of tantalum crucibles, stirrers, and cans from MSE, salt scrub, and anode heel processes. Eight containers have an EPA Code of D008 (lead). Building 777, the Coatings Laboratory, generated material during a 2-year period of operation from 1988 until 1990. This material consists primarily of various heavy metals used in the research and development of coating technologies. These backlog containers have been associated with lead as a constituent and were produced after 1987. The Residue Treatment Technology Group, Building 779, generated crucibles, stirrers, and other general lab equipment derived from tantalum and tungsten. In Building 779, the Physical Metallurgy Group generated tantalum materials used in casting and cast testing. Additionally, the Surface Analysis Laboratory in Building 779 generated heavy metal samples primarily of depleted uranium (D-38). IDC 320 material was produced by Building 779 operations over a 10-year period from 1981 until 1991. Nine backlog containers have an EPA Code of D008 (lead), six were produced after 1987.</p>
Current Container Comments	N/A
EPA Comments	<p>One subpopulation (25A) was identified based on specific process knowledge and generation date. The EPA Code D008 was assigned to this subpopulation because of contact with known lead products and process association. This subpopulation consists of containers produced before or during 1987. The WEMS database lists the EPA Code D008 for these containers. Because of the generation date, a conservative position has been taken by placing backlog drums with the D008 (lead) EPA Code in this subpopulation. The primary buildings of generation were 371, 707, 771, 776, 779.</p> <p>Subpopulation 25B was identified based on specific process knowledge and generation date. At this time, the generation date has been used judiciously in separating and characterizing containers with lead. The EPA Code D008 was assigned to this subpopulation because of contact with known lead products and process association. This subpopulation consists of containers produced before or during 1987. The WEMS database lists the EPA Code D008 for these containers. Because of the generation date, a conservative position has been taken by placing backlog drums with the D008 (lead) EPA Code in this subpopulation. The primary buildings of generation were 371, 707, 771, 776, and 779.</p>
Management Comments	N/A
Acceptance Comments	Future generation is projected beyond 1999.
Final Form Comments	N/A

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste form consists of metallic lead in the form of sheets, bricks, or tape.

Physical form: solid

Currently, no analytical data for lead waste is available. Process knowledge is the basis for characterization of this waste form. Lead waste (IDC 321) from non-specific sources is believed to have only lead (D008) as a hazardous constituent. In numerous tests of elemental lead, EP toxicity values exceed those listed in Table 1, 40 CFR 261.24. It is assumed that IDC 321 would also exceed EP toxicity limits for lead.

Waste Stream Source Description Transuranic lead was generated at a number of locations throughout Rocky Flats and includes IDC 321. The as-low-as-reasonably-achievable (ALARA) principle requires that the exposure of workers to radiation be kept "as low as reasonable achievable." In support of this principle, selected components and surfaces of gloveboxes enclosing materials that generate elevated levels of penetrating radiation (primarily gamma radiation) are commonly covered with metallic lead sheeting. The lead serves to attenuate the radiation dose received by employees working in the glovebox or in proximity to the glovebox. Lead waste (IDC 321) components are generally composed of lead bricks, lead shielding, and lead tape.

The lead or lead-covered components may become waste due to replacement, modification, or decommissioning activities. The dates of generation for IDC 321 range from August 15, 1986 to March 1, 1994.

The lead waste form is not a by-product of any process routinely performed at Rocky Flats. According to WSRIC Building Books, lead is most commonly generated as a result of maintenance activities. The lead waste is generally composed of lead shielding, scrap lead metal, and lead tape. The lead waste is collected in standard waste drums. The lead waste form was generated in Buildings 371, 559, 707, 771, 776, 777, and 779.

This stream is generated from Facility Operations, Analytical Laboratories, and R&D Laboratories.

Current Container Comments N/A

EPA Comments Drums Containing Scrap Lead Metal and Lead Shielding

Scrap lead metal and lead shielding exhibit the characteristic of toxicity for lead (D008). Subpopulation 8A was identified based on specific process knowledge and analytical results from elemental lead waste. According to WEMS, WSRIC, drums reports, and internal correspondence, the waste primarily consists of lead bricks, lead shielding, and scrap lead metal. Although some of waste could have come in contact with solvents, it is not considered to be a listed waste if the metal was wiped down with solvents for decontamination or paint stripping purposes, or if it was generated by the decommissioning of gloveboxes or other container-like apparatuses. Additional EPA codes are assigned to the waste based on process knowledge.

Management Comments N/A

Acceptance Comments RFP has determined this waste form to be LDR waste based on process knowledge available for TRU lead waste (IDC 321) and the fact that elemental lead exceeds values for EP toxicity pursuant to 40 CFR 261.24.

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. WASTE_PACK: This waste is packaged in 55-gallon drums lined with a fiberboard liner and two polyethylene bag liners.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description 328 - Flu-Flo filters from the recovery incineration, building 771. Mixed Waste.

Waste Stream Source Description Item Description Code 328-Ful-Flo Filters From Building 771 Incinerator

These Ful-Flo filters are in-line cartridge filters used to remove particulates from specific fluid streams in Building 771.

During normal process operations, IDC 328 Ful-Flo filters in the backlog population were used to filter particulates from the incinerator fume scrubber system in Building 771. These filters were used for the filtration of caustic solutions; therefore, they are contaminated with bases and may contain free liquids.

During normal process operations, IDC 331 Ful-Flo filters in this backlog population were used to filter particulates from liquid waste streams in Buildings 371, 707, 771, 776, 777, and 779. These waste streams were primarily from filtration of caustic solutions in Building 371, the carbon tetrachloride system and oil systems, and from filtration of water and developer in Building 707. In Building 771, the primary waste streams filtered were anion column feed, potassium hydroxide, nitrate feed, spent nitric acid and hydrofluoric acid from the scrubber, eluate and effluent exiting the ion-exchange columns, floor pick-up solution were filtered in Building 776. In Buildings 777 and 779, Ful-Flo filters were used in the carbon tetrachloride system for purification of Freon TF and for filtration of incoming waters.

Typically, Ful-Flo filters were placed on drying racks pending bag-out of a glovebox. Filters were not always dried before removal from the glovebox. Filters were then "bagged out" of the glovebox and placed in a second layer of plastic. Next, the filters were placed in a "Poly bottle" or "Clam Shell" (hard plastic container), then placed in a double-lined drum.

Item Description Code-331 Ful-Flo filters Not From Incinerator

These Ful-Flo filters are in-line cartridge filters used throughout Rocky Flats to remove particulates from fluid streams and typically filter down to 5, 1, and 0.5 micron-sized particulates. Ful-Flo filters are used in various liquid systems that include nitric- and chloride-acid systems, such as those found in plutonium recovery operations; caustic systems, such as those found in utilities scrubbing; solvent systems using carbon tetrachloride in machining operations; water systems, such as steam cleaning; and condensate collection. These filters are also used in lubricant oil filtration.

Ful-Flo filters are poly-fiber-wound cartridges, about 10" long by 3.5" in diameter. Other fiber filters, such as R-6 pads, may be included in this IDC. R-6 pads are cloth filters, about sixteen inches in diameter, used to filter solids from nitric acid solutions. Therefore, backlog material in this IDC cannot be considered homogeneous. Filter elements are produced by combining a media blanket and spirally wound matrix yarn on an inner core. The filter elements might have a polypropylene cap on one end. Both the media blanket and matrix yarn can be cotton or polypropylene. The inner core material can be constructed of polypropylene, tinned steel, or stainless steel. Warehouse data from Rocky Flats indicate that the inner-core material is polypropylene.

During normal process operations, IDC 331 Ful-Flo filters in this backlog population were used to filter particulates from liquid waste streams in Buildings 371, 707, 771, 776, 777, and 779. These waste streams were primarily from filtration of caustic solutions in Building 371, the carbon tetrachloride system and oil systems, and from filtration of water and developer in Building 707. In Building 771, the primary waste streams filtered were anion column feed, potassium hydroxide, nitrate feed, spent nitric acid and hydrofluoric acid from the scrubber, eluate and effluent exiting the ion-exchange columns, floor pick-up solution, steam condensate, and miscellaneous aqueous solutions. Hydraulic oil and floor pick-up solution were filtered in Building 776. In Buildings 777 and 779, Ful-Flo filters were used in the carbon tetrachloride system for purification of Freon TF and for filtration of incoming waters.

Typically, Ful-Flo filters were placed on drying racks pending bag-out of a glovebox. Filters were not always dried before removal from the glovebox. Filters were then "bagged out" of the glovebox and placed in a second layer of plastic. Next, the filters were placed in a "Poly Bottle" or "Clam Shell" (hard plastic container), then placed in a double-lined drum.

These Ful-Flo filters may be contaminated with acids, bases, carbon tetrachloride, chromium, Freon, and oil. They may contain relatively small amounts of free liquids.

TWBIR ID: RF-MT-0328

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Item Description Code 335-HEPA Glovebox Filters, Not Acid Contaminated

The material in this IDC is High Efficiency Particulate Air (HEPA) filters used in ventilation systems at Rocky Flats. HEPA filters have been and are used in all of the buildings which contain plutonium processing activities. HEPA filters are used on gloveboxes and in large filter plenums that filter the room air.

Used filters were removed from their position in the ventilation system and packaged for further processing. The filters used on gloveboxes (nominal 8" x 8" x 5") were identified as IDC 335 if they were not acid contaminated.

Item Description Code 342-HEPA Glovebox Filters, Acid Contaminated

HEPA filters are used on all gloveboxes to remove particulates from the atmosphere exiting the glovebox to the plenum exhaust system. The filters in IDC 342 are from gloveboxes with atmospheres that could cause the filters to be contaminated with acids or bases used in chemical processing.

Item Description Code 491-Plenum Prefilters

The material in this IDC is a variety of plenum prefilters used in the ventilation systems at Rocky Flats. Plenum prefilters have been and are used in all of the buildings that contain plutonium processing activities. These prefilters are used in large plenums that filter the room and glovebox air. Used prefilters were removed from their position in the ventilation system and packaged for further processing.

IDC 491 plenum prefilters range from furnace-type filters to pleated fiberglass filters and can be as large as 24" x 24" x 12". The filter medium consists of fiberglass packing or paper which may be more or less dense, depending on filtering needs. Wire mesh can be used to hold the media in place. The frame material for these prefilters is cardboard.

Item Description Code 492-HEPA Filters (24" x 24"), Acid Contaminated

The material in this IDC is HEPA filters used in the ventilation systems at Rocky Flats. HEPA filters have been and are used in all of the buildings which contain plutonium processing activities. HEPA filters are used on gloveboxes and in large plenums that filter the room and glovebox air.

Used filters were removed from their position in the ventilation system and packaged for further processing. The larger-sized filters used in filter plenums were identified and packaged as IDC 492 if acid contaminated.

IDC 492 HEPA filters (24" x 24"), acid contaminated, are large HEPA filters (nominal 24" x 24" x 5" or 24" x 24" x 12") that were used in filter plenum racks. These filters consist of filter media contained within a wooden or metal frame.

This waste form is generated from Facility/Equipment Operation, Maintenance, Analytical Laboratories, R&D Laboratories, D&D, and limited Emergency Response actions.

Current Container Comments N/A

EPA Comments All waste with D001, D002, and D003 codes will be processed or repackaged prior to shipment to WIPP per Geoff Asmus. Ful-Flo filters from various buildings are also segregated based on their generation prefixes. The generation prefix corresponds to a Material Balance Account (MBA). Specific gloveboxes in Building 771 have been identified as having nitric acid spray exposure such that "crystals" of nitrate salts have been reported to have formed on the filters causing them to meet the definition of a DOT oxidizer (EG&G 1993d). These gloveboxes were correlated to WSRIC processes and then to generation prefixes to characterize the filters generated from them.

Ful-Flo filters which filtered solutions containing chromium are included in Subpopulations BA, BE, and BH. The EPA Code D007 (chromium) does not apply because the solutions were generated from tanks and are nearly exclusively trivalent chromium. The processes did not generate hexavalent chromium, and

TWBIR ID: RF-MT-0328

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

these wastes were managed in a non-oxidizing environment (CDH 1994).

Subpopulation 54AA

Subpopulation 54AA consists of all IDC 328 filters. These six drums contain Ful-Flo filters from the Building 771 incinerator. It is assumed that all the drums contain free liquids. Because potassium hydroxide is used to neutralize acidic vapors in the incinerator, the liquid is characterized as RCRA hazardous due to exhibiting the characteristic of corrosivity and assigned EPA Code D002. EPA Codes F001, F002, F003, and F005 are assigned because these codes have been applied to the incinerator ash which has contacted these filters.

Management Comments N/A

Acceptance Comments

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. WASTE_PACK: Filter waste is packaged in 55-gallon drums and metal standard waste boxes.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists of rags, paper, cloth, coveralls, plastic, rubber, and wood. The waste consists mainly of cloth and paper products from cleanup of gloveboxes and spills. The bulk of these wastes are packaged in 55-gallon drums with one rigid polyethylene liner and several bag liners. In addition, the waste may be packaged in DOT 7A Type A metal boxes which are lined with a fiberboard liner and a PVC liner or standard TRUPACT-II container. The containers are then assayed and transferred to interim status storage areas. These wastes have been shipped to the INEL for storage in the past. RF-330, 356, 337, 821, 822, 853, 831, 832, 833. Predominantly combustible debris.

Waste Stream Source Description Combustible wastes were produced by materials-handling and cleanup from production, research and development, laboratory, utility, custodial and maintenance activities. The combustible wastes form includes wipes, gloves, paper and plastics.

Item Description 330, Combustibles, Dry

IDC 330 is Dry Combustibles. This IDC is dry combustibles such as cloth, paper, and wood. This IDC changes to 821, 831, 851, or 861 at the point of assay, depending on radiological content. Containers of IDC 330 currently in inventory were generated in all buildings handling fissile material.

Item Description 336, Combustibles, Wet

Wet combustibles are paper, cloth, etc., which contain a discernible amount of moisture and must be drained or wrung out prior to packaging to prevent an accumulation of free liquid. This IDC changes to 822, 832, 852, or 862 at the point of assay.

Item Description 337, Plastic (Teflon, PVC, Polyethylene)

IDC 337 represents PVC sheeting, poly bottles, supplied-air suits, polyethylene, and other plastics. IDC 337 changes to 825, 833, 853, or 863 at the point of assay.

Item Description 821, Combustibles, Dry TRU Waste

Dry transuranic combustible wastes, such as paper, cloth, and wood are classified as IDC 821.

Item Description 822, Combustibles, Wet TRU Waste

Wet combustible transuranic wastes, such as paper, cloth, and wood, which contain a discernible amount of moisture must be drained or wrung out prior to packaging to prevent accumulation of free liquid. These wastes are classified as IDC 822.

Item Description 831, Combustibles, Dry, TRU Mixed Waste

Dry combustibles such as paper, cloth, wood, etc. This waste has been identified as being low level mixed waste.

Item Description 832, Combustibles, Wet, TRU Mixed Waste

Wet combustibles such as paper, cloth, and wood which contain a discernible amount of moisture. These combustibles must be drained or wrung prior to packaging to prevent accumulation of free liquid.

Item Description 833, Plastic TRU Mixed Waste

PVC sheeting, poly bottles, supplied air suits, and other plastics. This waste has been identified as being a low level mixed waste.

Item Description 853, Plastic (Teflon, PVC, and Polyethylene)

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT0330

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

This waste has been identified as being a low level mixed waste, consisting of PVC sheeting, poly bottles, supplied-air suits, and other plastics.

Current Container Comments N/A

EPA Comments A- Process knowledge based upon general knowledge of waste type or source (e.g., there is some probability of a waste constituent being absent or present).

Bounding analytical data have not been compiled in a form that is compatible with this report. This effort has been completed and the results are available in the Final Backlog Baseline Book dated September 26, 1994.

Management Comments N/A

Acceptance Comments GENERAAREA: Numerous locations throughout RFP.GENOPERATI: RECLASS_CO: Rocky Flats assays wastes to determine waste type instead of relying on process knowledge or historical data. For this reason, the potential for reclassification has not been analyzed.CATION: Not applicable
OTHER_CHAR: No information available.

RFP has assumed this waste to be LDR based on process knowledge characterization, and one sample analyzed for volatiles in 1988.
1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. Analytical data are limited. WASTE_PACK: This waste is stored in 55 gallon carbon steel drums with one rigid polyethylene liner and several bag liners and standard metal boxes.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description 331 - Ful-Flo filters used to filter solids from aqueous solutions. Additional required processing undetermined. Because of the potential of liquids in this IDC, it requires a compatibility code when packaging.

Waste Stream Source Description Item Description Code 328-Ful-Flo Filters From Building 771 Incinerator

These Ful-Flo filters are in-line cartridge filters used to remove particulates from specific fluid streams in Building 771.

During normal process operations, IDC 328 Ful-Flo filters in the backlog population were used to filter particulates from the incinerator fume scrubber system in Building 771. These filters were used for the filtration of caustic solutions; therefore, they are contaminated with bases and may contain free liquids.

During normal process operations, IDC 331 Ful-Flo filters in this backlog population were used to filter particulates from liquid waste streams in Buildings 371, 707, 771, 776, 777, and 779. These waste streams were primarily from filtration of caustic solutions in Building 371, the carbon tetrachloride system and oil systems, and from filtration of water and developer in Building 707. In Building 771, the primary waste streams filtered were anion column feed, potassium hydroxide, nitrate feed, spent nitric acid and hydrofluoric acid from the scrubber, eluate and effluent exiting the ion-exchange columns, floor pick-up solution were filtered in Building 776. In Buildings 777 and 779, Ful-Flo filters were used in the carbon tetrachloride system for purification of Freon TF and for filtration of incoming waters.

Typically, Ful-Flo filters were placed on drying racks pending bag-out of a glovebox. Filters were not always dried before removal from the glovebox. Filters were then "bagged out" of the glovebox and placed in a second layer of plastic. Next, the filters were placed in a "Poly bottle" or "Clam Shell" (hard plastic container), then placed in a double-lined drum.

Item Description Code-331 Ful-Flo filters Not From Incinerator

These Ful-Flo filters are in-line cartridge filters used throughout Rocky Flats to remove particulates from fluid streams and typically filter down to 5, 1, and 0.5 micron-sized particulates. Ful-Flo filters are used in various liquid systems that include nitric- and chloride-acid systems, such as those found in plutonium recovery operations; caustic systems, such as those found in utilities scrubbing; solvent systems using carbon tetrachloride in machining operations; water systems, such as steam cleaning; and condensate collection. These filters are also used in lubricant oil filtration.

Ful-Flo filters are poly-fiber-wound cartridges, about 10" long by 3.5" in diameter. Other fiber filters, such as R-6 pads, may be included in this IDC. R-6 pads are cloth filters, about sixteen inches in diameter, used to filter solids from nitric acid solutions. Therefore, backlog material in this IDC cannot be considered homogeneous. Filter elements are produced by combining a media blanket and spirally wound matrix yarn on an inner core. The filter elements might have a polypropylene cap on one end. Both the media blanket and matrix yarn can be cotton or polypropylene. The inner core material can be constructed of polypropylene, tinned steel, or stainless steel. Warehouse data from Rocky Flats indicate that the inner-core material is polypropylene.

During normal process operations, IDC 331 Ful-Flo filters in this backlog population were used to filter particulates from liquid waste streams in Buildings 371, 707, 771, 776, 777, and 779. These waste streams were primarily from filtration of caustic solutions in Building 371, the carbon tetrachloride system and oil systems, and from filtration of water and developer in Building 707. In Building 771, the primary waste streams filtered were anion column feed, potassium hydroxide, nitrate feed, spent nitric acid and hydrofluoric acid from the scrubber, eluate and effluent exiting the ion-exchange columns, floor pick-up solution, steam condensate, and miscellaneous aqueous solutions. Hydraulic oil and floor pick-up solution were filtered in Building 776. In Buildings 777 and 779, Ful-Flo filters were used in the carbon tetrachloride system for purification of Freon TF and for filtration of incoming waters.

Typically, Ful-Flo filters were placed on drying racks pending bag-out of a glovebox. Filters were not always dried before removal from the glovebox. Filters were then "bagged out" of the glovebox and placed in a second layer of plastic. Next, the filters were placed in a "Poly Bottle" or "Clam Shell" (hard plastic container), then placed in a double-lined drum.

These Ful-Flo filters may be contaminated with acids, bases, carbon tetrachloride, chromium, Freon, and oil. They may contain relatively small amounts of free

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT-0331

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

liquids.

Item Description Code 335-HEPA Glovebox Filters, Not Acid Contaminated

The material in this IDC is High Efficiency Particulate Air (HEPA) filters used in ventilation systems at Rocky Flats. HEPA filters have been and are used in all of the buildings which contain plutonium processing activities. HEPA filters are used on gloveboxes and in large filter plenums that filter the room air.

Used filters were removed from their position in the ventilation system and packaged for further processing. The filters used on gloveboxes (nominal 8" x 8" x 5") were identified as IDC 335 if they were not acid contaminated.

Item Description Code 342-HEPA Glovebox Filters, Acid Contaminated

HEPA filters are used on all gloveboxes to remove particulates from the atmosphere exiting the glovebox to the plenum exhaust system. The filters in IDC 342 are from gloveboxes with atmospheres that could cause the filters to be contaminated with acids or bases used in chemical processing.

Item Description Code 491-Plenum Prefilters

The material in this IDC is a variety of plenum prefilters used in the ventilation systems at Rocky Flats. Plenum prefilters have been and are used in all of the buildings that contain plutonium processing activities. These prefilters are used in large plenums that filter the room and glovebox air. Used prefilters were removed from their position in the ventilation system and packaged for further processing.

IDC 491 plenum prefilters range from furnace-type filters to pleated fiberglass filters and can be as large as 24" x 24" x 12". The filter medium consists of fiberglass packing or paper which may be more or less dense, depending on filtering needs. Wire mesh can be used to hold the media in place. The frame material for these prefilters is cardboard.

Item Description Code 492-HEPA Filters (24" x 24"), Acid Contaminated

The material in this IDC is HEPA filters used in the ventilation systems at Rocky Flats. HEPA filters have been and are used in all of the buildings which contain plutonium processing activities. HEPA filters are used on gloveboxes and in large plenums that filter the room and glovebox air.

Used filters were removed from their position in the ventilation system and packaged for further processing. The larger-sized filters used in filters plenums were identified and packaged as IDC 492 if acid contaminated.

IDC 492 HEPA filters (24" x 24"), acid contaminated, are large HEPA filters (nominal 24" x 24" x 5" or 24" x 24" x 12") that were used in filter plenum racks. These filters consist of filter media contained within a wooden or metal frame.

This waste form is generated from Facility/Equipment Operation, Maintenance, Analytical Laboratories, R&D Laboratories, D&D, and limited Emergency Response actions.

Current Container Comments N/A

EPA Comments All waste with D001, D002, and D003 codes will be processed or repackaged prior to shipment to WIPP per Geoff Asmus. Ful-Flo filters from various buildings are also segregated based on their generation prefixes. The generation prefix corresponds to a Material Balance Account (MBA). Specific gloveboxes in Building 771 have been identified as having nitric acid spray exposure such that "crystals" of nitrate salts have been reported to have formed on the filters causing them to meet the definition of a DOT oxidizer (EG&G 1993d). These gloveboxes were correlated to WSRIC processes and then to generation prefixes to characterize the filters generated from them.

Ful-Flo filters which filtered solutions containing chromium are included in Subpopulations BA, BE, and BH. The EPA Code D007 (chromium) does not apply

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT-0331

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

because the solutions were generated from tanks and are nearly exclusively trivalent chromium. The processes did not generate hexavalent chromium, and these wastes were managed in a non-oxidizing environment (CDH 1994).

Subpopulation 54BA

The four generation prefixes of the nine drums of IDC 331 filters generated in Building 371 indicate that all the filters could have been generated from any process in the building using Ful-Flos. These filters may contain free liquids and exhibit the characteristic of corrosivity. These filters in Subpopulation 54 BA are, therefore, RCRA hazardous and are assigned EPA Code D002.

Subpopulation 54BB

Generation Prefix 12, Module C consists of processes in Building 707 which used IDC 331 Ful-Flo filters to filter oil and carbon tetrachloride. The material filtered is based on information in WSRIC. The single container of filters in Subpopulation 54BB is RCRA hazardous because the filters contain carbon tetrachloride and EPA Code F001 is assigned

Subpopulation 54BC

Generation prefix 15 corresponds to WSRIC Process 6, Machining-Module A, in Building 707. The IDC 331 Ful-Flo filters from this process were used to filter oil and Freon, according to the WSRIC book for Building 707. These 16 containers of filters in Subpopulation 54BC are RCRA hazardous because they contain the F-listed constituent trichloro-trifluoroethane, and are assigned EPA Codes F001 and F002.

Subpopulation 54BD

Generation prefix 22 corresponds to WSRIC processes 4-7, 11-13, 18-20, 23 and 26 in Building 707. The IDC 331 Ful-Flo filters from these processes were used to filter oil, carbon tetrachloride, and Freon, according to WSRIC.

Generation prefix 23 corresponds to WSRIC processes 7,8,9,11, and 12 in Building 777. Generation prefixes 54 and 779 may include any process in Building 779. According to current and archived WSRIC information, the IDC 331 Ful-Flo filters from these processes may have been used to filter oil, carbon tetrachloride, and Freon.

These containers of filters in Subpopulation 54BD are RCRA hazardous because they contain the F-listed constituents carbon tetrachloride and trichloro-trifluoroethane. They are therefore assigned EPA Codes F001 and F002.

Subpopulation 54BE

Subpopulation 54BE consists of all IDC 331 Ful-Flo filters generated from processes in Building 771. There are 146 containers of filters in this subpopulation. These filters could have been used to filter either acidic or caustic liquids, since specific information on the point of generation for each container could not be obtained. Seventeen of these drums were checked for free liquids by Real-Time Radiography (RTR) during "courtesy" inspection in 1993. Because 16 of these drums were evaluated by RTR as having free liquids, all drums in this subpopulation are assumed to have free liquids containing acids or bases that are free liquids. These liquids may exhibit the characteristic of corrosivity, and are assigned EPA Code D002.

Subpopulation 54BF

Generation prefix 04 is used for the Building 777 Radiography Process (Process 777-10). The building of generation should be changed in WEMS from 707 to 777. Based on archived WSRIC information for Radiography, the IDC 331 Ful-Flo filters were used to filter caustic solutions. The single container of filters in Subpopulation 54BF is RCRA hazardous because the filters are assumed to contain free liquids which exhibit the characteristic of corrosivity. EPA Code D002 has therefore been assigned. Additional investigation is warranted to further evaluate if the container has free liquids.

Subpopulation 54BH

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT-0331

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Subpopulation 54BH includes all IDC 331 Ful-Flo filters which are shown in WEMS as being generated in Building 776 with prefixes 19, 25, 26, or 57. Based on the WSRIC book for Building 776, these filters could contain acids or bases which are free liquids, and therefore could exhibit the characteristic of corrosivity. The D002 EPA Code is assigned for corrosivity. The filters might have been used to filter oil, carbon tetrachloride, and Freon; therefore, they are assigned EPA Codes F001 and F002.

Management Comments N/A

Acceptance Comments

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. WASTE_PACK: Filter waste is packaged in 55-gallon drums and metal standard waste boxes.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description 335 - High efficiency particulate air filters used on glovebox air intakes and exhausts.

Waste Stream Source Description Item Description Code 328-Ful-Flo Filters From Building 771 Incinerator

These Ful-Flo filters are in-line cartridge filters used to remove particulates from specific fluid streams in Building 771.

During normal process operations, IDC 328 Ful-Flo filters in the backlog population were used to filter particulates from the incinerator fume scrubber system in Building 771. These filters were used for the filtration of caustic solutions; therefore, they are contaminated with bases and may contain free liquids.

During normal process operations, IDC 331 Ful-Flo filters in this backlog population were used to filter particulates from liquid waste streams in Buildings 371, 707, 771, 776, 777, and 779. These waste streams were primarily from filtration of caustic solutions in Building 371, the carbon tetrachloride system and oil systems, and from filtration of water and developer in Building 707. In Building 771, the primary waste streams filtered were anion column feed, potassium hydroxide, nitrate feed, spent nitric acid and hydrofluoric acid from the scrubber, eluate and effluent exiting the ion-exchange columns, floor pick-up solution were filtered in Building 776. In Buildings 777 and 779, Ful-Flo filters were used in the carbon tetrachloride system for purification of Freon TF and for filtration of incoming waters.

Typically, Ful-Flo filters were placed on drying racks pending bag-out of a glovebox. Filters were not always dried before removal from the glovebox. Filters were then "bagged out" of the glovebox and placed in a second layer of plastic. Next, the filters were placed in a "Poly bottle" or "Clam Shell" (hard plastic container), then placed in a double-lined drum.

Item Description Code-331 Ful-Flo filters Not From Incinerator

These Ful-Flo filters are in-line cartridge filters used throughout Rocky Flats to remove particulates from fluid streams and typically filter down to 5, 1, and 0.5 micron-sized particulates. Ful-Flo filters are used in various liquid systems that include nitric- and chloride-acid systems, such as those found in plutonium recovery operations; caustic systems, such as those found in utilities scrubbing; solvent systems using carbon tetrachloride in machining operations; water systems, such as steam cleaning; and condensate collection. These filters are also used in lubricant oil filtration.

Ful-Flo filters are poly-fiber-wound cartridges, about 10" long by 3.5" in diameter. Other fiber filters, such as R-6 pads, may be included in this IDC. R-6 pads are cloth filters, about sixteen inches in diameter, used to filter solids from nitric acid solutions. Therefore, backlog material in this IDC cannot be considered homogeneous. Filter elements are produced by combining a media blanket and spirally wound matrix yarn on an inner core. The filter elements might have a polypropylene cap on one end. Both the media blanket and matrix yarn can be cotton or polypropylene. The inner core material can be constructed of polypropylene, tinned steel, or stainless steel. Warehouse data from Rocky Flats indicate that the inner-core material is polypropylene.

During normal process operations, IDC 331 Ful-Flo filters in this backlog population were used to filter particulates from liquid waste streams in Buildings 371, 707, 771, 776, 777, and 779. These waste streams were primarily from filtration of caustic solutions in Building 371, the carbon tetrachloride system and oil systems, and from filtration of water and developer in Building 707. In Building 771, the primary waste streams filtered were anion column feed, potassium hydroxide, nitrate feed, spent nitric acid and hydrofluoric acid from the scrubber, eluate and effluent exiting the ion-exchange columns, floor pick-up solution, steam condensate, and miscellaneous aqueous solutions. Hydraulic oil and floor pick-up solution were filtered in Building 776. In Buildings 777 and 779, Ful-Flo filters were used in the carbon tetrachloride system for purification of Freon TF and for filtration of incoming waters.

Typically, Ful-Flo filters were placed on drying racks pending bag-out of a glovebox. Filters were not always dried before removal from the glovebox. Filters were then "bagged out" of the glovebox and placed in a second layer of plastic. Next, the filters were placed in a "Poly Bottle" or "Clam Shell" (hard plastic container), then placed in a double-lined drum.

These Ful-Flo filters may be contaminated with acids, bases, carbon tetrachloride, chromium, Freon, and oil. They may contain relatively small amounts of free liquids.

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT-0335

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Item Description Code 335-HEPA Glovebox Filters, Not Acid Contaminated

The material in this IDC is High Efficiency Particulate Air (HEPA) filters used in ventilation systems at Rocky Flats. HEPA filters have been and are used in all of the buildings which contain plutonium processing activities. HEPA filters are used on gloveboxes and in large filter plenums that filter the room air.

Used filters were removed from their position in the ventilation system and packaged for further processing. The filters used on gloveboxes (nominal 8" x 8" x 5") were identified as IDC 335 if they were not acid contaminated.

Item Description Code 342-HEPA Glovebox Filters, Acid Contaminated

HEPA filters are used on all gloveboxes to remove particulates from the atmosphere exiting the glovebox to the plenum exhaust system. The filters in IDC 342 are from gloveboxes with atmospheres that could cause the filters to be contaminated with acids or bases used in chemical processing.

Item Description Code 491-Plenum Prefilters

The material in this IDC is a variety of plenum prefilters used in the ventilation systems at Rocky Flats. Plenum prefilters have been and are used in all of the buildings that contain plutonium processing activities. These prefilters are used in large plenums that filter the room and glovebox air. Used prefilters were removed from their position in the ventilation system and packaged for further processing.

IDC 491 plenum prefilters range from furnace-type filters to pleated fiberglass filters and can be as large as 24" x 24" x 12". The filter medium consists of fiberglass packing or paper which may be more or less dense, depending on filtering needs. Wire mesh can be used to hold the media in place. The frame material for these prefilters is cardboard.

Item Description Code 492-HEPA Filters (24" x 24"), Acid Contaminated

The material in this IDC is HEPA filters used in the ventilation systems at Rocky Flats. HEPA filters have been and are used in all of the buildings which contain plutonium processing activities. HEPA filters are used on gloveboxes and in large plenums that filter the room and glovebox air.

Used filters were removed from their position in the ventilation system and packaged for further processing. The larger-sized filters used in filter plenums were identified and packaged as IDC 492 if acid contaminated.

IDC 492 HEPA filters (24" x 24"), acid contaminated, are large HEPA filters (nominal 24" x 24" x 5" or 24" x 24" x 12") that were used in filter plenum racks. These filters consist of filter media contained within a wooden or metal frame.

This waste form is generated from Facility/Equipment Operation, Maintenance, Analytical Laboratories, R&D Laboratories, D&D, and limited Emergency Response actions.

Current Container Comments N/A

EPA Comments Subpopulation 54CC

These containers of IDC 335 filters are identified by prefix 746, indicating that they might have been generated from anywhere in Building 774. Because the IDC 335 filters from Process 774-5 are characterized in WSRIC as hazardous and cannot be segregated from other filters in this prefix, all filters in Subpopulation 54CC must be characterized as hazardous. These filters might have been contaminated by sludges containing oil, Freon TF, carbon tetrachloride, and 1,1,1-trichloroethane, from the OASIS Process (774-5). EPA Codes F001 and F002 have therefore been applied.

Other EPA codes are assigned to this waste form for newly generated waste characterized by the generator using process knowledge. Discussion of these

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists of rags, paper, cloth, coveralls, plastic, rubber, and wood. The waste consists mainly of cloth and paper products from cleanup of gloveboxes and spills. The bulk of these wastes are packaged in 55-gallon drums with one rigid polyethylene liner and several bag liners. In addition, the waste may be packaged in DOT 7A Type A metal boxes which are lined with a fiberboard liner and a PVC liner or standard TRUPACT-II container. The containers are then assayed and transferred to interim status storage areas. These wastes have been shipped to the INEL for storage in the past. RF-330, 356, 337, 821, 822, 853, 831, 832, 833. Predominantly combustible debris.

Waste Stream Source Description Combustible wastes were produced by materials-handling and cleanup from production, research and development, laboratory, utility, custodial and maintenance activities. The combustible wastes form includes wipes, gloves, paper and plastics.

Item Description 330, Combustibles, Dry

IDC 330 is Dry Combustibles. This IDC is dry combustibles such as cloth, paper, and wood. This IDC changes to 821, 831, 851, or 861 at the point of assay, depending on radiological content. Containers of IDC 330 currently in inventory were generated in all buildings handling fissile material.

Item Description 336, Combustibles, Wet

Wet combustibles are paper, cloth, etc., which contain a discernible amount of moisture and must be drained or wrung out prior to packaging to prevent an accumulation of free liquid. This IDC changes to 822, 832, 852, or 862 at the point of assay.

Item Description 337, Plastic (Teflon, PVC, Polyethylene)

IDC 337 represents PVC sheeting, poly bottles, supplied-air suits, polyethylene, and other plastics. IDC 337 changes to 825, 833, 853, or 863 at the point of assay.

Item Description 821, Combustibles, Dry TRU Waste

Dry transuranic combustible wastes, such as paper, cloth, and wood are classified as IDC 821.

Item Description 822, Combustibles, Wet TRU Waste

Wet combustible transuranic wastes, such as paper, cloth, and wood, which contain a discernible amount of moisture must be drained or wrung out prior to packaging to prevent accumulation of free liquid. These wastes are classified as IDC 822.

Item Description 831, Combustibles, Dry, TRU Mixed Waste

Dry combustibles such as paper, cloth, wood, etc. This waste has been identified as being low level mixed waste.

Item Description 832, Combustibles, Wet, TRU Mixed Waste

Wet combustibles such as paper, cloth, and wood which contain a discernible amount of moisture. These combustibles must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

Item Description 833, Plastic TRU Mixed Waste

PVC sheeting, poly bottles, supplied air suits, and other plastics. This waste has been identified as being a low level mixed waste.

Item Description 853, Plastic (Teflon, PVC, and Polyethylene)

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT0336

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

This waste has been identified as being a low level mixed waste, consisting of PVC sheeting, poly bottles, supplied-air suits, and other plastics.

Current Container Comments N/A

EPA Comments A- Process knowledge based upon general knowledge of waste type or source (e.g., there is some probability of a waste constituent being absent or present).

Bounding analytical data have not been compiled in a form that is compatible with this report. This effort has been completed and the results are available in the Final Backlog Baseline Book dated September 26, 1994.

Management Comments N/A

Acceptance Comments GENERAAREA: Numerous locations throughout RFP.GENOPERATI: RECLASS_CO: Rocky Flats assays wastes to determine waste type instead of relying on process knowledge or historical data. For this reason, the potential for reclassification has not been analyzed.CATION: Not applicable
OTHER_CHAR: No information available.

RFP has assumed this waste to be LDR based on process knowledge characterization, and one sample analyzed for volatiles in 1988.

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. Analytical data are limited. WASTE_PACK: This waste is stored in 55 gallon carbon steel drums with one rigid polyethylene liner and several bag liners and standard metal boxes.

This waste has been identified as being a low level mixed waste, consisting of PVC sheeting, poly bottles, supplied-air suits, and other plastics.

Current Container Comments N/A

EPA Comments A- Process knowledge based upon general knowledge of waste type or source (e.g., there is some probability of a waste constituent being absent or present).

Bounding analytical data have not been compiled in a form that is compatible with this report. This effort has been completed and the results are available in the Final Backlog Baseline Book dated September 26, 1994.

Management Comments N/A

Acceptance Comments GENERAAREA: Numerous locations throughout RFP.GENOPERATI: RECLASS_CO: Rocky Flats assays wastes to determine waste type instead of relying on process knowledge or historical data. For this reason, the potential for reclassification has not been analyzed.CATION: Not applicable
OTHER_CHAR: No information available.

RFP has assumed this waste to be LDR based on process knowledge characterization, and one sample analyzed for volatiles in 1988.

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. Analytical data are limited. WASTE_PACK: This waste is stored in 55 gallon carbon steel drums with one rigid polyethylene liner and several bag liners and standard metal boxes.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is a solid matrix consisting of gloves with lead lining. There could be some free liquids in waste containers.

Waste Stream Source Description Leaded glovebox gloves are generated as waste at Rocky Flats by processes requiring a controlled atmosphere in Buildings 371, 374, 559, 707, 771, 774, 776, 777, 778, and 779 and encompasses IDCs 339 and 341. Prior to January 22, 1986, all leaded glovebox gloves were accumulated together as IDC 339 (Leaded Glovebox Gloves). At that time, IDC 341 (Leaded Glovebox Gloves, Acid Contaminated) was created. IDC 339 became "Leaded Glovebox Gloves, Nonacid Contaminated." Leaded glovebox gloves are replaced by schedule or as needed.

All backlog leaded glovebox gloves (IDC 0339 and 0341) were washed in Building 776 until about September 1989, at which time the process was curtailed. The primary purpose of the washing process was to remove the accountable material; however, the acid from the acid-contaminated gloves (IDC 341) was removed as well. After the acid-contaminated gloves were washed, the IDC was changed from 341 to 339. The glove washing process was curtailed upon completion of the inventory of backlog gloves.

Due to degradation from contact with process materials during normal process operations and age, the leaded glovebox gloves are replaced according to schedule or as necessary. Nonacid-contaminated leaded glovebox gloves (IDC 339) are generated as waste or residue depending on the assay, in Buildings 371, 374, 559, 707, 771, 774, 776, 779. Acid contaminated leaded glovebox gloves (IDC 341) were washed in Building 776 after which they were assigned IDC 339.

This stream is generated from Facility Operations, Analytical Laboratories, and R&D Laboratories.

Current Container Comments N/A

EPA Comments Subpopulation 42C: This Subpopulation consists of IDC 339 nonacid contaminated glovebox gloves in Building 774. The waste was characterized as hazardous under WSRIC process numbers 774-3-3, 774-5-2, 774-9-3, and 774-10-7. According to process knowledge, this waste exhibits the characteristic of toxicity for cadmium, chromium, and lead. The waste also contains spent halogenated solvents, and it meets the definition of an F-listed waste. Therefore, this waste is assigned EPA Waste Codes D006, D007, D008, F001, F002, and F005.

Subpopulation 42E: This Subpopulation includes containers previously identified in Subpopulation 42A, which have been reassessed based on a review of WSRIC information. Based on the archived WSRIC information, Buildings 707 and 777 conducted machining operations using cutting oils and solvents such as carbon tetrachloride, 1,1,1-trichloroethane, and 1,1,2-trichloro-1,2,2-trifluoroethane (Freon TF). These oil/solvent mixtures were re-used for a period of time before being piped to C-Pit (in the basement beneath Module C) where they passed through Ful-Flo filters to recover a portion of the plutonium before being sent as waste to Building 774 for treatment. These operations were conducted in gloveboxes that were fitted with leaded gloves. If the leaded gloves were visibly contaminated when discarded, they would be considered F001 and F002 listed wastes under the mixture rule. Leaded gloves will still carry the EPA Waste Code D008 for lead.

Leaded gloves were periodically changed out and accumulated in waste drums. These gloves had an expiration date, but it is undetermined how often they were changed out. However, it is known that production operations were curtailed in late 1989. Based on a review of the headspace gas VOC (HGVO) analytical data, the above solvents are consistently detected in IDC 339 drums that have accumulation start dates or fill dates prior to April 1990. From this information it can be inferred that leaded gloves generated in any area of Buildings 707 and 777 prior to April 1990 will be contaminated with oils and solvents.

Headspace gas sampling performed during the TRU Waste Characterization Program detected chloroform in sampled containers above the Program Required Quantitation Limit (PRQL). Subsequent review of the headspace gas sampling data and reconsideration of process knowledge confirms the initial conclusion that these leaded glovebox gloves are hazardous waste. Based on further review of process knowledge, there is no indication this waste became contaminated with chloroform. Nevertheless, Procedure WIPP-009 (RCRA Characterization of TRU Waste to be Disposed of at WIPP) requires the addition of applicable EPA Codes to containers when compounds indicative of spent solvents are measured in the headspace gas above PRQL. EPA Code D022 will be added prior to shipment offsite. Until shipment, these leaded glovebox gloves will continue to be managed as hazardous waste.

TWBIR ID: RF-MT0339

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Management Comments N/A

Acceptance Comments RFP has assumed this waste to be LDR based on the fact that lead is a RCRA listed waste exhibiting the characteristic of toxicity.

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. WASTE_PACK: The gloves are packaged in 55-gallon drums lined with a rigid polyethylene liner and one bag liner.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description 342 - Drybox filters from all acid lines.

Waste Stream Source Description Item Description Code 328-Ful-Flo Filters From Building 771 Incinerator

These Ful-Flo filters are in-line cartridge filters used to remove particulates from specific fluid streams in Building 771.

During normal process operations, IDC 328 Ful-Flo filters in the backlog population were used to filter particulates from the incinerator fume scrubber system in Building 771. These filters were used for the filtration of caustic solutions; therefore, they are contaminated with bases and may contain free liquids.

During normal process operations, IDC 331 Ful-Flo filters in this backlog population were used to filter particulates from liquid waste streams in Buildings 371, 707, 771, 776, 777, and 779. These waste streams were primarily from filtration of caustic solutions in Building 371, the carbon tetrachloride system and oil systems, and from filtration of water and developer in Building 707. In Building 771, the primary waste streams filtered were anion column feed, potassium hydroxide, nitrate feed, spent nitric acid and hydrofluoric acid from the scrubber, eluate and effluent exiting the ion-exchange columns, floor pick-up solution were filtered in Building 776. In Buildings 777 and 779, Ful-Flo filters were used in the carbon tetrachloride system for purification of Freon TF and for filtration of incoming waters.

Typically, Ful-Flo filters were placed on drying racks pending bag-out of a glovebox. Filters were not always dried before removal from the glovebox. Filters were then "bagged out" of the glovebox and placed in a second layer of plastic. Next, the filters were placed in a "Poly bottle" or "Clam Shell" (hard plastic container), then placed in a double-lined drum.

Item Description Code-331 Ful-Flo filters Not From Incinerator

These Ful-Flo filters are in-line cartridge filters used throughout Rocky Flats to remove particulates from fluid streams and typically filter down to 5, 1, and 0.5 micron-sized particulates. Ful-Flo filters are used in various liquid systems that include nitric- and chloride-acid systems, such as those found in plutonium recovery operations; caustic systems, such as those found in utilities scrubbing; solvent systems using carbon tetrachloride in machining operations; water systems, such as steam cleaning; and condensate collection. These filters are also used in lubricant oil filtration.

Ful-Flo filters are poly-fiber-wound cartridges, about 10" long by 3.5" in diameter. Other fiber filters, such as R-6 pads, may be included in this IDC. R-6 pads are cloth filters, about sixteen inches in diameter, used to filter solids from nitric acid solutions. Therefore, backlog material in this IDC cannot be considered homogeneous. Filter elements are produced by combining a media blanket and spirally wound matrix yarn on an inner core. The filter elements might have a polypropylene cap on one end. Both the media blanket and matrix yarn can be cotton or polypropylene. The inner core material can be constructed of polypropylene, tinned steel, or stainless steel. Warehouse data from Rocky Flats indicate that the inner-core material is polypropylene.

During normal process operations, IDC 331 Ful-Flo filters in this backlog population were used to filter particulates from liquid waste streams in Buildings 371, 707, 771, 776, 777, and 779. These waste streams were primarily from filtration of caustic solutions in Building 371, the carbon tetrachloride system and oil systems, and from filtration of water and developer in Building 707. In Building 771, the primary waste streams filtered were anion column feed, potassium hydroxide, nitrate feed, spent nitric acid and hydrofluoric acid from the scrubber, eluate and effluent exiting the ion-exchange columns, floor pick-up solution, steam condensate, and miscellaneous aqueous solutions. Hydraulic oil and floor pick-up solution were filtered in Building 776. In Buildings 777 and 779, Ful-Flo filters were used in the carbon tetrachloride system for purification of Freon TF and for filtration of incoming waters.

Typically, Ful-Flo filters were placed on drying racks pending bag-out of a glovebox. Filters were not always dried before removal from the glovebox. Filters were then "bagged out" of the glovebox and placed in a second layer of plastic. Next, the filters were placed in a "Poly Bottle" or "Clam Shell" (hard plastic container), then placed in a double-lined drum.

These Ful-Flo filters may be contaminated with acids, bases, carbon tetrachloride, chromium, Freon, and oil. They may contain relatively small amounts of free liquids.

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT-0342

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Item Description Code 335-HEPA Glovebox Filters, Not Acid Contaminated

The material in this IDC is High Efficiency Particulate Air (HEPA) filters used in ventilation systems at Rocky Flats. HEPA filters have been and are used in all of the buildings which contain plutonium processing activities. HEPA filters are used on gloveboxes and in large filter plenums that filter the room air.

Used filters were removed from their position in the ventilation system and packaged for further processing. The filters used on gloveboxes (nominal 8" x 8" x 5") were identified as IDC 335 if they were not acid contaminated.

Item Description Code 342-HEPA Glovebox Filters, Acid Contaminated

HEPA filters are used on all gloveboxes to remove particulates from the atmosphere exiting the glovebox to the plenum exhaust system. The filters in IDC 342 are from gloveboxes with atmospheres that could cause the filters to be contaminated with acids or bases used in chemical processing.

Item Description Code 491-Plenum Prefilters

The material in this IDC is a variety of plenum prefilters used in the ventilation systems at Rocky Flats. Plenum prefilters have been and are used in all of the buildings that contain plutonium processing activities. These prefilters are used in large plenums that filter the room and glovebox air. Used prefilters were removed from their position in the ventilation system and packaged for further processing.

IDC 491 plenum prefilters range from furnace-type filters to pleated fiberglass filters and can be as large as 24" x 24" x 12". The filter medium consists of fiberglass packing or paper which may be more or less dense, depending on filtering needs. Wire mesh can be used to hold the media in place. The frame material for these prefilters is cardboard.

Item Description Code 492-HEPA Filters (24" x 24"), Acid Contaminated

The material in this IDC is HEPA filters used in the ventilation systems at Rocky Flats. HEPA filters have been and are used in all of the buildings which contain plutonium processing activities. HEPA filters are used on gloveboxes and in large plenums that filter the room and glovebox air.

Used filters were removed from their position in the ventilation system and packaged for further processing. The larger-sized filters used in filter plenums were identified and packaged as IDC 492 if acid contaminated.

IDC 492 HEPA filters (24" x 24"), acid contaminated, are large HEPA filters (nominal 24" x 24" x 5" or 24" x 24" x 12") that were used in filter plenum racks. These filters consist of filter media contained within a wooden or metal frame.

This waste form is generated from Facility/Equipment Operation, Maintenance, Analytical Laboratories, R&D Laboratories, D&D, and limited Emergency Response actions.

Current Container Comments N/A

EPA Comments All waste with D001, D002, and D003 codes will be processed or repackaged prior to shipment to WIPP per Geoff Asmus. Ful-Flo filters from various buildings are also segregated based on their generation prefixes. The generation prefix corresponds to a Material Balance Account (MBA).

Subpopulation 54EB

Subpopulation 54EB consists of IDC 342 filters generated from processes in Building 771 assigned to prefixes 02 and 74. The following gloveboxes have been determined to have had nitric acid spray exposure.

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT-0342

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Gloveboxes A-1, A-2, A-3, and A-4 in Room 174
Gloveboxes 13, 14, and 15 in Room 114
Glovebox 29 in Room 149

The gloveboxes in Room 174 are associated with the OY Leach Process which corresponds to prefix 74. The gloveboxes in Rooms 114 and 149 are associated with Batching, Precipitation, and other processes corresponding to prefix 02.

Other EPA codes are assigned to this waste form for newly generated waste characterized by the generator using process knowledge. Discussion of these characterizations may be found in the appropriate WSRIC building book.

Management Comments N/A

Acceptance Comments 1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. WASTE_PACK: Filter waste is packaged in 55-gallon drums and metal standard waste boxes.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists of iron shot, walnut shells, glass beads, and ceramic beads generated by grit blasting operations.

Waste Stream Source Description Item Description Code 292-Incinerator Sludge

IDC 292 was intended for incinerator sludge from the recovery incinerator in Building 771. IDC 292 materials were reassessed under Waste Form 1, Incinerator Ash. However, there is one box WEMS incorrectly assigned this IDC. According to the waste-box log sheet dated October 14, 1987, the box contains Electrochemical Milling Sludge generated in Building 881. This operation generated sludge from the milling of various metals including stainless steel. It was indicated that no cyanides were used in the ECM operations in Building 881. The IDC for this box should be changed to 299.

Item Description Code 299-Miscellaneous Sludge

This IDC has been used for sludges that were not accurately categorized as IDC 290 or 340 and could have been generated in any plutonium processing building. However, the backlog miscellaneous sludge was generated in Building 771 during the processing of residues, in Building 371 in the analytical laboratory, and in Building 883 by the Rolling Process. Process pipe sludge, sludge dissolution heel, and filter plenum sludge from Building 771 were processed through nitric acid dissolution and sparging. Soil and sludge samples from around the site were analyzed in Building 371, and the waste was stored for processing. IDC 299 materials generated in Building 883 include quench sludge and uranium oxide sludge from the Rolling Process. This group also includes one container of electrochemical milling sludge generated in Building 881 in October 1987. The container is assigned IDC 292.

Item Description Code 372-Grit

This IDC was generated by grit blasting operations in Building 371 (primarily for cleaning steel and iron) and Building 777 in the Machining and Coating processes (primarily cleaning shields). A variety of materials were used for the grit, including iron shot, walnut shells, glass beads, and ceramic beads. The majority of the grit is thought to be iron shot ranging in size from fines to irregular particles. There were apparently no other RCRA-regulated metals involved in the grit blasting. There is one drum of IDC 372 shown in WEMS as being generated in Building 371. However, no grit blasting operation could be identified in that building.

Item Description Code 823-Cemented Sludge

IDC 823, cemented miscellaneous sludge, was generated when sludge designated as inorganic particulate and sludgy material that was below the economic discard limit (EDL) was placed in 1-gallon paint cans and covered with Portland cement or mixed with cement into a block. The first scenario was conducted in Building 771 and the second in Building 371. This could have included IDCs 290-299 and was done to meet the Waste Isolation Pilot Plant (WIPP) waste acceptance criteria. The material came primarily from Nash pumps in Building 771 and included vacuum grease and oily sludge. One drum of the material was apparently generated when the pit in front of Building 707 was cleaned out. However, the contents of the pit sludge could not be ascertained. One drum was generated in the Size Reduction Vault in Building 776. Six drums were generated in Building 774 and are stored in Building 371. Drum-specific information was requested but was not received. The drums from Building 559 are incorrectly assigned IDC 823 in WEMS. The drums are stored in Building 771 and are labeled with IDC 863. It appears that IDC 823 was entered incorrectly in WEMS. Therefore, these drums should be changed to IDC 863 in WEMS.

This waste form is generated from Facility/Equipment Operation, Maintenance, Analytical Laboratories, R&D Laboratories, D&D, and limited Emergency Response actions.

Current Container Comments N/A

EPA Comments Subpopulation 46DA includes one drum generated in Building 371, according to WEMS. WEMS also indicates that the drum contains D007 waste. This drum contains grit from grit blasting of stainless steel and could contain chromium. This information could not be verified or refuted at the time this document was produced. Therefore, the drum is characterized as hazardous and assigned EPA Waste Code D007 until proven otherwise. The drum is also prohibited from

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists of blacktop/concrete/dirt/sand.

Waste Stream Source Description Soil and cleanup-debris (IDC 374) were generated during cleanup and construction activities around Rocky Flats. In most cases, construction or demolition activities generated rubble consisting of blacktop, concrete, dirt, sand, and rock. The rubble was packaged in plywood boxes with a fiberboard liner and a polyvinyl chloride (PVC) bag liner or in 55-gallon, DOT Type 7A drums. The waste was generated on a nonroutine basis. Information describing spendid activities generating soil and debris were often unavailable.

Current Container Comments N/A

EPA Comments Subpopulation 23B-Container Number D48510 was generated in Building 374, Room 3803. Room 3803 houses part of the Building 374 Sludge Immobilization Process. The process generated solidified sludge. The waste in drum D48510 is potentially contaminated with process sludge. The sludge consists of RCRA-regulated materials from Decontamination-Precipitation and Neutralization Processes in the Building 374 Liquid Waste Treatment Facility. Building 374 solidified sludge is characterized in the Building 374 Solidified Sludge Backlog Waste Reassessment Baseline Book.

Building 374 sludge was intermittently contaminated with RCRA metals (EPA Codes D004–D011). Sampling and analysis of solidified sludge found the waste exceeded toxicity characteristic criteria for chromium (EPA Code D007) and selenium (D010), but at very low levels. It will be assumed that the waste contained in drum D48510 would not exhibit the characteristic of toxicity for chromium and selenium because of dilution by the soil and debris. Toxicity Characteristic Leaching Procedure (TCLP) analysis of the waste under EPA SW-846 (EPA 1990) is required to prove the waste does not exceed toxicity characteristic criteria.

Contaminated soil and cleanup debris must carry the listed EPA codes associated with Building 374 solidified sludge. The EPA Codes F001, F002, F005, F006, F007, and F009 are assigned to the waste and it will not be considered as meeting the Land Disposal Restrictions (LDR) treatment standards until sampling and analysis prove otherwise.

Subpopulation 23D- According to WEMS drum D75005 was generated in Building 776. However, the waste was repackaged in Building 776 in April 1988 after a failed drum containing the waste was discovered in the Property Utilization and Disposal (PU&D) storage yard. Drum D75055 contains soil and two sample vials of chromium oxide and aluminum oxide. It will be assumed that the waste contained in drum D75005 exhibits the characteristic of toxicity for chromium (D007) because of chromium oxide contamination.

Subpopulation 23Y includes insulation (IDC 374) that was originally characterized as hazardous under WSRIC process number 374-6-33. The Building 374 process treatment system is used to treat aqueous waste from throughout the site, including F-listed wastes and product and/or off-spec chemicals. Therefore, waste generated from 374-6-33 since 1994 meets the definition of an F-listed waste as well as the definition of P- and U-listed waste. This waste was also generated under NRWOLs 231-1-11, MM331001, and TI027079. NRWOL MM331001 identifies hazardous silicate filters that have visible residue from the inspection of Freon containing units in building 374. NRWOL TI027079 identifies hazardous concrete pieces and granules chipped from around process liquid drains. The concrete has been in contact with process liquid, which was determined to be RCRA hazardous. NRWOL 231-1-11 identifies dirt and rocks picked up from a spill from Tanker #6. The liquid in Tanker #6 was determined to be hazardous, radioactive waste from building 374.

RTR performed on 4/29/98 identified approximately 90ml of liquid in D85534. NRWOL TI027079 identified EPA Waste Code F003. Based on the above information, this waste is characterized as hazardous and EPA Waste Codes F001, F002, F003, F005, F006, F007, F009, P030, P098, P099, P106, U003, U103, and U108 will be applied to this waste.

Management Comments N/A

Acceptance Comments GENERAAREA: Plutonium process areas. GENOPERATION: Generated in multiple buildings in which aqueous plutonium recovery or plutonium fabrication

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: **RF-MT0374**

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

processes were conducted. RECLASS_CO: Rocky Flats assays wastes to determine waste type instead of relying on process knowledge or historical data. For this reason, the potential for reclassification has not been analyzed. CATION: Not Applicable. OTHER_CHAR: Not Applicable.

RFP has determined this waste to be LDR based on process knowledge characterization.

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. WASTE_PACK: 55 gallon carbon steel DOT 7A Type A Drum.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste form is firebrick that has been crushed and pulverized.

Waste Stream Source Description During incinerator maintenance and stripout operations, firebrick used to line the firebox (IDCs 371, 373, 377 and 378) was generated in Buildings 371 and 771. A bed liner material used in the FBI in Building 776 was also generated. This material was a sodium carbonate and sand material but was assigned IDC 371, firebrick. The following sections describe the specific wastes, by IDC, generated by the incinerators.

Item Description Code 371, Firebrick

Firebrick was generated during maintenance operations in the incineration systems in Building 771. This material was also generated during incinerator stripout operations in Building 371. Firebrick consists of brick and chunks of high-density alumina ceramic material used to line the firebox of the incinerator. The current inventory contains 30 drums of LLW, residues, and mixed residues.

IDC 371 is mixed residue only.

Item Description Code 373, Firebrick Heel

During dissolution of scarfed firebrick (IDC 377 and 378), undissolved firebrick heel was generated in Building 771. Spent firebrick was subjected to a mechanical scarfing process to remove plutonium-bearing surface layers. Those layers were pulverized and subjected to a nitric acid dissolution process. The material that did not dissolve was filtered, dried, assayed, and set aside for additional processing. The current inventory contains four drums of mixed residues.

IDC 373 is mixed residue only.

Item Description Code 377, Coarse Firebrick

During maintenance operations, coarse chunks of scarfed firebrick were generated in Building 771. This material was also generated during incinerator stripout operations in Building 371. Spent firebrick was subjected to a mechanical scarfing process to remove plutonium-bearing surface layers. Coarse firebrick consists of chunks of the unpulverized, plutonium-bearing surface layer of the high-density alumina ceramic firebrick material. The current inventory contains 66 drums of transuranic waste, mixed transuranic waste, and residues.

Item Description Code 378, Scarfed Firebrick

During maintenance operations, pulverized scarfed firebrick was generated in Building 771. This material was also generated during incinerator stripout operations in Building 371. Spent firebrick was subjected to a mechanical scarfing process to remove plutonium-bearing surface layers. Pulverized firebrick consists of chunks granular, fine, and very fine, plutonium-bearing surface layer of the high-density alumina ceramic firebrick material. The current inventory contains 45 drums mixed transuranic waste and residues.

Current Container Comments N/A

EPA Comments Subpopulations IK, IL, IM, IN

EPA Codes D004-D011, F001, F002, F003, and F005 were assigned to these subpopulations based on the characterization of incinerator feed materials. Based on the characterization of the feed, alcohols, glycols, halogenated solvents, and metals may have been introduced into the incinerator. Because the specific sources of the incinerator feed cannot be determined at this time, it has been assumed that the process could have accepted any of the combustible, plastic, or filter waste currently contained in the backlog that were generated during the time the incinerator was operational.

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT0377

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

A report was generated from the Backlog Waste Reassessment database that summarizes the EPA codes assigned to inventory containers of combustibles (IDCs 330 and 336), plastics (337), and Ful-Flo filters (331) generated about the same time that the incinerator was operational. The following EPA codes were contained in the database for these wastes; D004-D011, D018, D019, D028, D029, D035, D038, F001, F002, F003, and F005. It was assumed that the F-listed solvents would have to be applied due to the "derived-from" rule. The codes for the D-listed metals were applied because these metals would be concentrated during incineration. However, it was assumed that the D-listed solvent would be volatilized and driven off in this process. Therefore, these solvents would not be present at levels exceeding Toxicity Characteristic Leaching Procedure (TCLP) limits due to the thermal treatment. This subpopulation is land disposal restricted due to the presence of RCRA metals. It is not land disposal restricted for F-listed solvents because the Best Demonstrated Available Technology (BDAT) (thermal treatment) was used to treat this waste.

Management Comments N/A

Acceptance Comments Net and gross weight data are not available for all container types.

1. Variability surrounding fullness of containers precludes a meaningful computation of density.

2. Basis for determining LDR storage prohibition status is based primarily on process knowledge. The waste is packaged in 55- gallon drums lined with a rigid polyethylene liner.

Projected future generation begins in CY2005.

Final Form Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste form is firebrick that has been crushed and pulverized.

Waste Stream Source Description During incinerator maintenance and stripout operations, firebrick used to line the firebox (IDCs 371, 373, 377 and 378) was generated in Buildings 371 and 771. A bed liner material used in the FBI in Building 776 was also generated. This material was a sodium carbonate and sand material but was assigned IDC 371, firebrick. The following sections describe the specific wastes, by IDC, generated by the incinerators.

Item Description Code 371, Firebrick

Firebrick was generated during maintenance operations in the incineration systems in Building 771. This material was also generated during incinerator stripout operations in Building 371. Firebrick consists of brick and chunks of high-density alumina ceramic material used to line the firebox of the incinerator. The current inventory contains 30 drums of LLW, residues, and mixed residues.

IDC 371 is mixed residue only.

Item Description Code 373, Firebrick Heel

During dissolution of scarfed firebrick (IDC 377 and 378), undissolved firebrick heel was generated in Building 771. Spent firebrick was subjected to a mechanical scarfing process to remove plutonium-bearing surface layers. Those layers were pulverized and subjected to a nitric acid dissolution process. The material that did not dissolve was filtered, dried, assayed, and set aside for additional processing. The current inventory contains four drums of mixed residues.

IDC 373 is mixed residue only.

Item Description Code 377, Coarse Firebrick

During maintenance operations, coarse chunks of scarfed firebrick were generated in Building 771. This material was also generated during incinerator stripout operations in Building 371. Spent firebrick was subjected to a mechanical scarfing process to remove plutonium-bearing surface layers. Coarse firebrick consists of chunks of the unpulverized, plutonium-bearing surface layer of the high-density alumina ceramic firebrick material. The current inventory contains 66 drums of transuranic waste, mixed transuranic waste, and residues.

Item Description Code 378, Scarfed Firebrick

During maintenance operations, pulverized scarfed firebrick was generated in Building 771. This material was also generated during incinerator stripout operations in Building 371. Spent firebrick was subjected to a mechanical scarfing process to remove plutonium-bearing surface layers. Pulverized firebrick consists of chunks granular, fine, and very fine, plutonium-bearing surface layer of the high-density alumina ceramic firebrick material. The current inventory contains 45 drums mixed transuranic waste and residues.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is a fire particulate ash. It could also be chunky material from moisture.

Waste Stream Source Description This waste form consists of waste generated by the Residue Recovery Incinerator system in Building 771, Fluidized Bed Incinerator (FBI) in Building 776, and test runs by the incinerator in Building 371.

The Low-Specific Activity (LSA) and High-Specific Activity (HSA) incinerators in Building 371 were developed as volume-reduction incinerators. The startup operation test used noncontaminated materials throughout the processes. The test revealed design concerns; therefore, these incinerators never became operational. No WSRIC information is available to describe this process in greater detail.

The function of the Residue Recovery Incinerator was to reduce volume and destroy volatile constituents prior to plutonium recovery operations for combustible wastes from production processes (primarily IDCs 330, 331, 336, and 337). Waste feed was hand-sorted to segregate combustibles. Noncombustibles such as metal and glass were segregated and removed from the process. The by-products of this process included ash (IDCs 419, 420, 421, and 428).

The FBIs in Building 776 were developed as pilot operations. Their test function was to develop new technology to reduce volume and destroy volatile constituents prior to plutonium recovery operations. The only incinerator to generate backlog waste covered by this waste form was the Full-Scale Unit. The first runs of this incinerator (1978 to 1981) used newspaper, Building 776 low-level waste (LLW), combustible waste, kerosene, garage oil, and grease as test materials. The tests were conducted with methanol, diesel products, and nonradioactive surrogate combustibles (shredded coveralls, leather gloves, rolls of polyvinyl chloride [PVC] plastic, wood, and paper). The by-product of this process was FBI ash (IDC 425).

Item Description Code 419, Unpulverized Incinerator Ash

Unpulverized incinerator ash was generated as an intermediate product during routine operation of the incinerator in Building 771. This material was also generated during incinerator stripout operations in Building 371. The unpulverized ash consists of a mixture of coarse, granular, fine, and very fine particulates. The ash contains miscellaneous tramp metal, bits of unburned feed material, and carbon from the incomplete oxidation of feed material. The coarse materials consist of fused ash, clinkers, or unburned materials that fell through the stationary grate of the incinerator.

IDC 419 is mixed residue only.

Item Description Code 420, Pulverized Incinerator Ash

Pulverized incinerator ash was generated as an intermediate product during routine operation of the incinerator in Building 771. This material was also generated during incinerator stripout operations in Building 371. The pulverized ash consists of a mixture of coarse, granular, fine, and very fine particulates that have been ground by the ball mill. The ash contains miscellaneous tramp metal, bits of unburned feed material, and carbon from the incomplete oxidation of feed material.

Item Description Code 421, Ash Heel

During dissolution of incinerator ash (IDC 419 and 420), undissolved incinerator ash heel was generated in Building 771. Incinerator ash was subjected to a nitric acid dissolution process. The material that did not dissolve was filtered, dried, assayed, and set aside for additional processing.

IDC 421 is mixed residue only.

Item Description Code 425, Fluidized Bed Ash

This waste is a mixture of aluminum oxide and a chromium oxide oxidation catalyst, sodium carbonate, and ash, mainly catalyst and sodium carbonate ash from Building 776. During the incineration of materials containing chloride compounds, a portion of the sodium carbonate changes to sodium chloride.

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT0420

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

The Pilot-Scale FBI Unit was operated from 1971 to 1978. The first runs used PVC, polyethylene, and paper as test materials. After 1974, paint thinner from the Building 333 paint shop, tributyl phosphate, kerosene, and hydrazine hydrate were burned. Polychlorinated biphenyls (PCBs), mixed 1 part PCB to 4-5 parts diesel fuel or kerosene were burned in 1978. Unless containers of backlog waste were generated during maintenance operations of the Pilot-Scale Unit, all containers in the current inventory were generated after 1978 and are assumed to be from the Full-Scale Unit. Though the Pilot-Scale Unit burned PCBs, the ash is not Toxic Substance Control Act (TSCA) regulated. The incinerator burned at a high destruction efficiency and PCBs over the TSCA regulatory limit of 50 parts per million (ppm) are not anticipated in the ash.

The Full-Scale Unit was operated from 1978 to 1981, and again from 1985 to 1988. The first runs (1978 to 1981) used newspaper, Building 776 LLW, combustible waste, kerosene, garage oil, and grease as test materials. The tests from 1985 to 1988 were conducted with methanol, diesel products, and nonradioactive surrogate combustibles (shredded coveralls, leather gloves, rolls of PVC plastic, wood, and paper).

Item Description Code 428, Incinerator Ash

After incinerator ash (IDC 420) was generated in Building 771, this material was prepared, assayed, and packaged in Building 371, for transportation to an alternate DOE site for plutonium recovery processing. This material does not differ from incinerator ash IDC 420.

IDC 428 is mixed residue only.

Current Container Comments N/A

EPA Comments The last subpopulation consists of IDC 420 backlog containers. EPA codes D004-D011, F001, F002, F003, and F005 were assigned to this subpopulation based on the characterization of incinerator feed materials (alcohols, glycols, halogenated solvents, and metals). However, this subpopulation contained no free liquids and thus D002 is not applied.

Subpopulations 1F, 1G, 1P, and 1Q, consist of IDCs 420, 421, 423, 371, 373, 377, 378, 422, 428, and 419, respectively, for backlog inventory containers. EPA Codes D004-D011, F001, F002, F003, and F005 were assigned to this subpopulation.

Limited analytical data indicate that this waste form exceeds the LDR treatment standard for chromium. These data must complete data validation. The results to date are discussed in the Waste Characterization Report, Incinerator Ash, Item Description Codes 420 and 425.

Management Comments N/A

Acceptance Comments RFP has determined that incinerator ash is LDR waste based on available process knowledge.

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. FBI ash was packaged in 55-gallon drums lined with a rigid polyethylene liner and one bag liner.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is a fire particulate ash. It could also be chunky material from moisture.

Waste Stream Source Description This waste form consists of waste generated by the Residue Recovery Incinerator system in Building 771, Fluidized Bed Incinerator (FBI) in Building 776, and test runs by the incinerator in Building 371.

The Low-Specific Activity (LSA) and High-Specific Activity (HSA) incinerators in Building 371 were developed as volume-reduction incinerators. The startup operation test used noncontaminated materials throughout the processes. The test revealed design concerns; therefore, these incinerators never became operational. No WSRIC information is available to describe this process in greater detail.

The function of the Residue Recovery Incinerator was to reduce volume and destroy volatile constituents prior to plutonium recovery operations for combustible wastes from production processes (primarily IDCs 330, 331, 336, and 337). Waste feed was hand-sorted to segregate combustibles. Noncombustibles such as metal and glass were segregated and removed from the process. The by-products of this process included ash (IDCs 419, 420, 421, and 428).

The FBIs in Building 776 were developed as pilot operations. Their test function was to develop new technology to reduce volume and destroy volatile constituents prior to plutonium recovery operations. The only incinerator to generate backlog waste covered by this waste form was the Full-Scale Unit. The first runs of this incinerator (1978 to 1981) used newspaper, Building 776 low-level waste (LLW), combustible waste, kerosene, garage oil, and grease as test materials. The tests were conducted with methanol, diesel products, and nonradioactive surrogate combustibles (shredded coveralls, leather gloves, rolls of polyvinyl chloride [PVC] plastic, wood, and paper). The by-product of this process was FBI ash (IDC 425).

Item Description Code 419, Unpulverized Incinerator Ash

Unpulverized incinerator ash was generated as an intermediate product during routine operation of the incinerator in Building 771. This material was also generated during incinerator stripout operations in Building 371. The unpulverized ash consists of a mixture of coarse, granular, fine, and very fine particulates. The ash contains miscellaneous tramp metal, bits of unburned feed material, and carbon from the incomplete oxidation of feed material. The coarse materials consist of fused ash, clinkers, or unburned materials that fell through the stationary grate of the incinerator.

IDC 419 is mixed residue only.

Item Description Code 420, Pulverized Incinerator Ash

Pulverized incinerator ash was generated as an intermediate product during routine operation of the incinerator in Building 771. This material was also generated during incinerator stripout operations in Building 371. The pulverized ash consists of a mixture of coarse, granular, fine, and very fine particulates that have been ground by the ball mill. The ash contains miscellaneous tramp metal, bits of unburned feed material, and carbon from the incomplete oxidation of feed material.

Item Description Code 421, Ash Heel

During dissolution of incinerator ash (IDC 419 and 420), undissolved incinerator ash heel was generated in Building 771. Incinerator ash was subjected to a nitric acid dissolution process. The material that did not dissolve was filtered, dried, assayed, and set aside for additional processing.

IDC 421 is mixed residue only.

Item Description Code 425, Fluidized Bed Ash

This waste is a mixture of aluminum oxide and a chromium oxide oxidation catalyst, sodium carbonate, and ash, mainly catalyst and sodium carbonate ash from Building 776. During the incineration of materials containing chloride compounds, a portion of the sodium carbonate changes to sodium chloride.

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT0425

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

The Pilot-Scale FBI Unit was operated from 1971 to 1978. The first runs used PVC, polyethylene, and paper as test materials. After 1974, paint thinner from the Building 333 paint shop, tributyl phosphate, kerosene, and hydrazine hydrate were burned. Polychlorinated biphenyls (PCBs), mixed 1 part PCB to 4-5 parts diesel fuel or kerosene were burned in 1978. Unless containers of backlog waste were generated during maintenance operations of the Pilot-Scale Unit, all containers in the current inventory were generated after 1978 and are assumed to be from the Full-Scale Unit. Though the Pilot-Scale Unit burned PCBs, the ash is not Toxic Substance Control Act (TSCA) regulated. The incinerator burned at a high destruction efficiency and PCBs over the TSCA regulatory limit of 50 parts per million (ppm) are not anticipated in the ash.

The Full-Scale Unit was operated from 1978 to 1981, and again from 1985 to 1988. The first runs (1978 to 1981) used newspaper, Building 776 LLW, combustible waste, kerosene, garage oil, and grease as test materials. The tests from 1985 to 1988 were conducted with methanol, diesel products, and nonradioactive surrogate combustibles (shredded coveralls, leather gloves, rolls of PVC plastic, wood, and paper).

Item Description Code 428, Incinerator Ash

After incinerator ash (IDC 420) was generated in Building 771, this material was prepared, assayed, and packaged in Building 371, for transportation to an alternate DOE site for plutonium recovery processing. This material does not differ from incinerator ash IDC 420.

IDC 428 is mixed residue only.

Current Container Comments N/A

EPA Comments One subpopulation consists of IDC 425 materials characterized under Backlog Waste Reassessment Task 7, Event 20, but only includes the ash generated by the Full-Scale unit. EPA code D007 was assigned to the subpopulation. The characterization rationale for this subpopulation can be found in the report prepared for this event.

Another subpopulation consists of IDC 425 materials characterized under Backlog Waste Reassessment Task 7, Event 20, but only includes ash generated by the Pilot-Scale unit. EPA codes D007, F003, and F005 were assigned to the subpopulation. The characterization rationale for this subpopulation can be found in the report prepared for this event.

Subpopulation 1D consists of IDC 425 materials characterized under Task 7, Event 20 but only includes the ash generated by the Pilot-Scale Unit. EPA Codes D007, F003, and F005 were assigned to the subpopulation. Rationale for this subpopulation can be found in the report prepared for this event.

Limited analytical data indicate that this waste form exceeds the LDR treatment standard for chromium. These data must complete data validation. The results to date are discussed in the Waste Characterization Report, Incinerator Ash, Item Description Codes 420 and 425.

Management Comments N/A

Acceptance Comments RFP has determined that incinerator ash is LDR waste based on available process knowledge.

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. FBI ash was packaged in 55-gallon drums lined with a rigid polyethylene liner and one bag liner.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is contaminated insulation.

Waste Stream Source Description Item Description Code 438

Maintenance, repair, and strip-out operations in Buildings 371, 374, 444, 559, 666, 707, 771, 774, 776, 777, 779, 865, 881, and 883 produced waste insulation. Insulation waste is generated by replacement of furnace heating elements, construction, maintenance, and demolition activities within the Protected Area at Rocky Flats. During these activities, insulation material is removed from furnaces, boilers, piping, ceilings and walls, and heating and cooling systems.

WEMS data indicate that insulation waste was generated in:

Building 374 Acid Neutralization, Radioactive Decontamination, Sludge Solidification, Evaporation, Spray Dryer and Saltcrete, and General Building Operations.

Building 444 Maintenance

Buildings 559 and 779 Utilities

Building 666 Drum Repack

Building 707 Foundry Operations-Module A, Casting-Module K, X-Y
Retriever-Module J, Maintenance, and Modules A-H

Building 771, Maintenance and General Building Waste

Building 774 Microwave Process

Building 776 during the replacement of furnace heating elements.

Generated by construction and demolition activities.

Current Container Comments N/A

EPA Comments Subpopulation 53D, IDC 438, was identified based on WEMS data, IDC, and discussion with generating personnel. The insulation in this subpopulation was used on pipes, walls, and other barriers and could have come in contact with listed constituents when leaks or spills occurred. According to the generator, the insulation was visibility contaminated with sludge and salt produced in Building 374. The D-codes currently assigned to containers in this subpopulation are not appropriate based on the volume of insulation relative to the amount of caked on sludge. The following EPA Codes were assigned to this waste: F001, F002, F003, F005, F006, F007, F009, and F039. This inventory was generated in Building 374. Other EPA codes are assigned to this waste form for newly generated waste characterized by the generator using process knowledge. Discussion of these characterizations may be found in the appropriate WSRIC building book.

Management Comments N/A

Acceptance Comments RFP has determined this waste to be LDR based on process knowledge characterization.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	This waste stream is made up of glass from analytical labs, recovery processes, ceramics, and glovebox windows.
Waste Stream Source Description	<p>IDC 440 includes glass waste from analytical laboratories and recovery processes, standard light bulbs generated inside the PA, and ceramic materials. Glass waste assigned IDC 440 was generated in Buildings 123, 371, 444, 559, 707, 771, 776, 777, 889.</p> <p>Raschig Rings currently in WEMS assigned IDC 442 were generated in Buildings 771, 776, and 777. Prior to being replaced, the tanks were drained and the rings were leached with dilute nitric acid or water. The rings generated in Building 771 are from the production processes and Tanks D80-D85, D0-360, D-361, D-451-D-454, D-467, D-750, D-706, D-922, D-973, D-974, D-980, D-1008, D-1013, D-1022, and D-1081. Rings generated in Building 776 are from the Size Reduction Process and Tanks SR 3,4, and 5 and as unused rings. Rings generated in Building 777 were generated by the Carbon Tetrachloride System in Tanks 1103, 1104, and 1106, Room 131, and by the Trichloroethane Collection and Filter System in Tanks T-1 and T-2, Room 430. The building 777 rings should be assigned IDC 443 as discussed in the following section.</p> <p>IDC 856 includes Raschig Rings which are removed from vessels containing RCRA regulated solvents. There is also glass from spent fluorescent lamps in some of these containers.</p> <p>This stream is generated from Facility Operations, Analytical Laboratories, and R&D Laboratories.</p>
Current Container Comments	N/A
EPA Comments	<p>Item Description Code 440</p> <p>This IDC was separated from IDC 444 (created in 1989 specifically for ground glass and leaded glass) because the two waste forms exhibit different chemical characteristics, hazardous constituents, and EPA codes. Therefore, drums of IDC 440 materials generated prior to 1989 could contain leaded glass. These are included in Subpopulation 17G and are assigned EPA codes D005 and D008.</p> <p>Subpopulation 27B is assigned EPA code D009 because of mercury in the spent fluorescent lamps.</p>
Management Comments	N/A
Acceptance Comments	<p>RFP has determined that this grouping is LDR waste based on available process knowledge with some of the IDCs identified containing listed hazardous components.</p> <p>1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. WASTE_PACK: DOT 7A TYPE A metal boxes and DOT 7A TYPE A drums.</p>
Final Form Comments	N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	This waste stream is made up of Raschig Rings which are borosilicate glass rings used to maintain subcritical conditions in fissile storage tanks.
Waste Stream Source Description	<p>IDC 440 includes glass waste from analytical laboratories and recovery processes, standard light bulbs generated inside the PA, and ceramic materials. Glass waste assigned IDC 440 was generated in Buildings 123, 371, 444, 559, 707, 771, 776, 777, 889.</p> <p>Raschig Rings currently in WEMS assigned IDC 442 were generated in Buildings 771, 776, and 777. Prior to being replaced, the tanks were drained and the rings were leached with dilute nitric acid or water. The rings generated in Building 771 are from the production processes and Tanks D80-D85, D0-360, D-361, D-451-D-454, D-467, D-750, D-706, D-922, D-973, D-974, D-980, D-1008, D-1013, D-1022, and D-1081. Rings generated in Building 776 are from the Size Reduction Process and Tanks SR 3,4, and 5 and as unused rings. Rings generated in Building 777 were generated by the Carbon Tetrachloride System in Tanks 1103, 1104, and 1106, Room 131, and by the Trichloroethane Collection and Filter System in Tanks T-1 and T-2, Room 430. The building 777 rings should be assigned IDC 443 as discussed in the following section.</p> <p>IDC 856 includes Raschig Rings which are removed from vessels containing RCRA regulated solvents. There is also glass from spent fluorescent lamps in some of these containers.</p> <p>This stream is generated from Facility Operations, Analytical Laboratories, and R&D Laboratories.</p>
Current Container Comments	N/A
EPA Comments	<p>Item Description Code 442</p> <p>In addition to the reference documents and WEMs information used, analytical data compiled by EG&G Rocky Flats were reviewed. The data shows that the concentrations of Toxicity Characteristic (TC) metals barium, cadmium, chromium, lead, and silver were well below regulated levels provided in 6 CCR 1007-3, Section 261.24.</p> <p>Subpopulation 17F includes Raschig Rings assigned IDC 442 that are contaminated with carbon tetrachloride, 1,1,1-trichloroethane, or both. Based on analytical data, Raschig Rings do not exhibit the characteristic of toxicity for metals. All containers in this group were generated in Building 777 according to WEMS. Rings generated in Building 777 were generated by the Carbon Tetrachloride System in Tanks 1103, 1104, and 1106, Room 131, and by the Trichloroethane Collection and Filter System in Tanks T-1 and T-2, Room 430. Therefore, it is assumed that these rings are all contaminated with carbon tetrachloride or 1,1,1-trichloroethane sludge. They are, therefore, assigned EPA Waste Codes F001 and F002.</p>
Management Comments	N/A
Acceptance Comments	<p>RFP has determined that this grouping is LDR waste based on available process knowledge with some of the IDCs identified containing listed hazardous components.</p> <p>1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. WASTE_PACK: DOT 7A TYPE A metal boxes and DOT 7A TYPE A drums.</p>

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Matrix consists of crushed glass light bulbs and leaded glass that is crushed on removal.

Waste Stream Source Description Item Description Code 444--Ground Glass and Leaded Glovebox Glass

This IDC includes ground fluorescent bulbs and leaded glass used throughout the plutonium-and uranium-processing areas. The material was generated as waste or residue when glovebox glass was replaced, or as low-level waste when fluorescent light bulbs were replaced. IDC 444 materials in the backlog inventory were generated in Building 371, 374, 559, 707, 771, and 776.

Item Description Code 855-Ground Glass

This IDC includes ground glass from fluorescent light bulbs. It can be used for waste generated outside the PA and for nonline-generated waste. In other words, it can only be used for low-level mixed waste.

Current Container Comments N/A

EPA Comments Analytical data showed the presence of toxic metals in some containers of IDC 444. Based on these analytical data, these materials are characterized as hazardous and assigned EPA codes D005 and D008.

Analytical data for IDC 855 show that there are enough cases where the samples fail the Toxicity Characteristic Leaching Procedure (TCLP), that the waste bulbs should be managed as hazardous waste and assigned the EPA code D009.

EPA codes are assigned to newly generated waste by the generator based on process knowledge.

Subpopulation 17G includes containers of leaded glovebox glass. Based on analytical data, these materials are characterized as hazardous and assigned EPA Waste Codes.

Management Comments N/A

Acceptance Comments LDR_DETERM: Net and gross weight data are not available for all container types.

RFP has assumed this waste to be LDR based on the fact that it is a RCRA listed waste.

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. WASTE_PACK: The glass waste is packaged in 55- gallon drums that are lined with one fiberboard liner and two polyethylene bags or metal boxes. Drums are placed in TRUPACT II containers.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is metal tools, etc. generated during glovebox operations.

Waste Stream Source Description The one container of IDC 480, Light metal, in this waste form was generated in Building 707, Module K, in April 1991. The metal in this container is line generated material.

Current Container Comments N/A

EPA Comments All waste with D001, D002, and D003 codes will be processed or repackaged prior to shipment to WIPP per Geoff Asmus. EPA codes are assigned to this waste form for newly generated waste characterized by the generator using process knowledge. Discussion of these characterizations may be found in the appropriate WSRIC building book.

Management Comments N/A

Acceptance Comments Rocky Flats assays wastes to determine waste type instead of relying on process knowledge or historical data. For this reason, the potential for reclassification has not been analyzed.

RFP has assumed this waste to be LDR based on process knowledge characterization.

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. Waste is packaged in 55 gallon DOT 7A Type A Drums. The drums are lined with one rigid polyethylene liner and several bag liners.

Final Form Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description "HEPA filters (24 x 24), not acid contaminated, are large HEPA filters used in the filter plenums of plutonium processing buildings to filter room and glovebox air. The materials of construction consist of a filter medium contained within a wood frame. Older medium consisted of glass fiber with a small percentage of asbestos and a corrugated aluminum foil. Newer medium is constructed of glass and aromatic polyamide fibers (Nomex) and aluminum alloy metal. Wood filter frames are constructed of 1/2-inch fire retardant exterior grade plywood, or particle board."

TWBIR ID: RF-MT-0491

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description 491 - Room air exhaust filters only. This waste must be collected in 55-gallon or 35-gallon drums for assay.

Waste Stream Source Description Item Description Code 328-Ful-Flo Filters From Building 771 Incinerator

These Ful-Flo filters are in-line cartridge filters used to remove particulates from specific fluid streams in Building 771.

During normal process operations, IDC 328 Ful-Flo filters in the backlog population were used to filter particulates from the incinerator fume scrubber system in Building 771. These filters were used for the filtration of caustic solutions; therefore, they are contaminated with bases and may contain free liquids.

During normal process operations, IDC 331 Ful-Flo filters in this backlog population were used to filter particulates from liquid waste streams in Buildings 371, 707, 771, 776, 777, and 779. These waste streams were primarily from filtration of caustic solutions in Building 371, the carbon tetrachloride system and oil systems, and from filtration of water and developer in Building 707. In Building 771, the primary waste streams filtered were anion column feed, potassium hydroxide, nitrate feed, spent nitric acid and hydrofluoric acid from the scrubber, eluate and effluent exiting the ion-exchange columns, floor pick-up solution were filtered in Building 776. In Buildings 777 and 779, Ful-Flo filters were used in the carbon tetrachloride system for purification of Freon TF and for filtration of incoming waters.

Typically, Ful-Flo filters were placed on drying racks pending bag-out of a glovebox. Filters were not always dried before removal from the glovebox. Filters were then "bagged out" of the glovebox and placed in a second layer of plastic. Next, the filters were placed in a "Poly bottle" or "Clam Shell" (hard plastic container), then placed in a double-lined drum.

Item Description Code-331 Ful-Flo filters Not From Incinerator

These Ful-Flo filters are in-line cartridge filters used throughout Rocky Flats to remove particulates from fluid streams and typically filter down to 5, 1, and 0.5 micron-sized particulates. Ful-Flo filters are used in various liquid systems that include nitric- and chloride-acid systems, such as those found in plutonium recovery operations; caustic systems, such as those found in utilities scrubbing; solvent systems using carbon tetrachloride in machining operations; water systems, such as steam cleaning; and condensate collection. These filters are also used in lubricant oil filtration.

Ful-Flo filters are poly-fiber-wound cartridges, about 10" long by 3.5" in diameter. Other fiber filters, such as R-6 pads, may be included in this IDC. R-6 pads are cloth filters, about sixteen inches in diameter, used to filter solids from nitric acid solutions. Therefore, backlog material in this IDC cannot be considered homogeneous. Filter elements are produced by combining a media blanket and spirally wound matrix yarn on an inner core. The filter elements might have a polypropylene cap on one end. Both the media blanket and matrix yarn can be cotton or polypropylene. The inner core material can be constructed of polypropylene, tinned steel, or stainless steel. Warehouse data from Rocky Flats indicate that the inner-core material is polypropylene.

During normal process operations, IDC 331 Ful-Flo filters in this backlog population were used to filter particulates from liquid waste streams in Buildings 371, 707, 771, 776, 777, and 779. These waste streams were primarily from filtration of caustic solutions in Building 371, the carbon tetrachloride system and oil systems, and from filtration of water and developer in Building 707. In Building 771, the primary waste streams filtered were anion column feed, potassium hydroxide, nitrate feed, spent nitric acid and hydrofluoric acid from the scrubber, eluate and effluent exiting the ion-exchange columns, floor pick-up solution, steam condensate, and miscellaneous aqueous solutions. Hydraulic oil and floor pick-up solution were filtered in Building 776. In Buildings 777 and 779, Ful-Flo filters were used in the carbon tetrachloride system for purification of Freon TF and for filtration of incoming waters.

Typically, Ful-Flo filters were placed on drying racks pending bag-out of a glovebox. Filters were not always dried before removal from the glovebox. Filters were then "bagged out" of the glovebox and placed in a second layer of plastic. Next, the filters were placed in a "Poly Bottle" or "Clam Shell" (hard plastic container), then placed in a double-lined drum.

These Ful-Flo filters may be contaminated with acids, bases, carbon tetrachloride, chromium, Freon, and oil. They may contain relatively small amounts of free liquids.

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT-0491

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Item Description Code 335-HEPA Glovebox Filters, Not Acid Contaminated

The material in this IDC is High Efficiency Particulate Air (HEPA) filters used in ventilation systems at Rocky Flats. HEPA filters have been and are used in all of the buildings which contain plutonium processing activities. HEPA filters are used on gloveboxes and in large filter plenums that filter the room air.

Used filters were removed from their position in the ventilation system and packaged for further processing. The filters used on gloveboxes (nominal 8" x 8" x 5") were identified as IDC 335 if they were not acid contaminated.

Item Description Code 342-HEPA Glovebox Filters, Acid Contaminated

HEPA filters are used on all gloveboxes to remove particulates from the atmosphere exiting the glovebox to the plenum exhaust system. The filters in IDC 342 are from gloveboxes with atmospheres that could cause the filters to be contaminated with acids or bases used in chemical processing.

Item Description Code 491-Plenum Prefilters

The material in this IDC is a variety of plenum prefilters used in the ventilation systems at Rocky Flats. Plenum prefilters have been and are used in all of the buildings that contain plutonium processing activities. These prefilters are used in large plenums that filter the room and glovebox air. Used prefilters were removed from their position in the ventilation system and packaged for further processing.

IDC 491 plenum prefilters range from furnace-type filters to pleated fiberglass filters and can be as large as 24" x 24" x 12". The filter medium consists of fiberglass packing or paper which may be more or less dense, depending on filtering needs. Wire mesh can be used to hold the media in place. The frame material for these prefilters is cardboard.

Item Description Code 492-HEPA Filters (24" x 24"), Acid Contaminated

The material in this IDC is HEPA filters used in the ventilation systems at Rocky Flats. HEPA filters have been and are used in all of the buildings which contain plutonium processing activities. HEPA filters are used on gloveboxes and in large plenums that filter the room and glovebox air.

Used filters were removed from their position in the ventilation system and packaged for further processing. The larger-sized filters used in filter plenums were identified and packaged as IDC 492 if acid contaminated.

IDC 492 HEPA filters (24" x 24"), acid contaminated, are large HEPA filters (nominal 24" x 24" x 5" or 24" x 24" x 12") that were used in filter plenum racks. These filters consist of filter media contained within a wooden or metal frame.

This waste form is generated from Facility/Equipment Operation, Maintenance, Analytical Laboratories, R&D Laboratories, D&D, and limited Emergency Response actions.

Current Container Comments N/A

EPA Comments Subpopulation 54HB includes wastes which were originally characterized as nonhazardous and assigned to Subpopulation 54HA, IDC 491 filters. Based on a Nonconformance Report, a lead lined glove (potentially acid-contaminated) has been identified in one container. Therefore, the waste may exhibit the characteristic for lead (D008).

WSRIC Process Number 374-6-36 consists of prefilters from the 321 Plenum in Building 374. According to process knowledge and supported by analytical data (sample Nos. 00Z1264 and 00Z1273), this output exhibits the RCRA hazardous characteristic of toxicity due to the presence of selenium. This output has come into contact with spent solvents and, therefore, meets the definition of an F-listed waste.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description These wastes are aqueous acidic liquid residues.

Waste Stream Source Description N/A

Current Container Comments N/A

EPA Comments All waste with D001, D002, and D003 codes will be processed or repackaged prior to shipment to WIPP per Geoff Asmus.
Subpopulation A

Subpopulation A includes acidic solutions generated in the Building 371 Analytical Laboratory. These solutions were sampled for pH and were determined to be corrosive (D002). Therefore, this subpopulation exhibits the characteristic of corrosivity as defined in 6 CCR 1007-3, Section 261.22.

Subpopulation H

These solutions were sampled for pH and were determined to be corrosive (D002). Twenty-eight bottles of newly generated solutions generated in Building 771 were sampled for metals. Nine bottles contained greater than 1.0 ppm cadmium, 20 contained greater than 5.0 ppm chromium, and nine contained greater than 5.0 ppm lead. Six bottles are below the regulatory levels for these metals.

In addition, Building 771 does X-Ray Fluorescence which uses silver chloride in the analysis. Silver is presumed to be in these solutions, but it has not been determined which bottles were generated from this process and if any of the bottles sampled were from this process.

This subpopulation exhibits the characteristics of corrosivity (D002) and toxicity for cadmium, chromium, and lead (D006, D007, and D008) as defined in 6 CCR 1007-3, Sections 261.22 and 261.24.

Management Comments N/A

Acceptance Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is a solid cemented sludge. It could have small amounts of free liquids in the bottom of the container.

Waste Stream Source Description Aqueous sludge wastes assigned IDCs 001 and 800 were generated by the high-level aqueous waste treatment system in Building 774. IDC 001 was replaced by IDC 800 in 1986.

A two-stage basic waste treatment, precipitation, and filtration process generates IDCs 001 and 800 aqueous sludge. Acidic wastes are neutralized with sodium hydroxide in stage one. Ferric sulfate and Purifloc flocculant are added to the neutralized waste (containing metal ions) to precipitate the sludge prior to filtration. In stage two, ferric sulfate, magnesium sulfate, calcium chloride, and Purifloc flocculant are added to basic wastes during the two-stage treatment to precipitate sludge. The sludge slurry from the acidic and basic waste treatment is drawn through a diatomite filter media on a rotating drum filter to trap the solids. The filter media and sludge are continuously scraped off the drum filter and co-fed into a 55-gallon drum with additional diatomite and Portland cement making up the solidification process. No mechanical mixing of the sludge and cement is performed.

Prior to 1979, IDC 001 consisted of sludge from the first-stage treatment only. When the first- and second-stage sludges were packaged separately, two vacuum filters were used. From 1979 to 1986, IDC 001 was a combination of the sludges from the first- and second-stage treatment processes. The sludge was produced chemically in the same fashion aqueous waste was treated to produce IDC 800 sludge. The solidification process for IDC 001 differs from the IDC 800 method of adding cement and diatomite as the sludge collects. Portland cement was added to the bottom of the IDC 001 drum prior to placing the sludge in the drum. In some cases additional Portland cement was added on top of the sludge.

Prior to September 1984, Building 774 accepted many aqueous process wastes from other buildings. These wastes, now piped to Building 374, were treated as described above. The accepted wastes included aqueous waste from Buildings 122, 123, 444, 559, 707, 776, 778, 779, 865, 881, 883, 889. After August 1984 and the start-up of the Building 374 Precipitation Process, only waste piped from Building 771 (stream condensate, scrubber waste, ion column effluent, and process waste sinks), waste in containers from various buildings, and wastes generated within Building 774 (silver recovery effluent, seal liquid, and floor washdown) were accepted. From 1986 through 1989, the treatment process treated from 150,000 gallons to over 500,000 gallons per year and generated 2,700 drums of IDCs and 800 sludge.

See Solidified Bypass Sludge/LLM for detailed descriptions of IDCs 007, 803, and 807.

Current Container Comments N/A

EPA Comments All waste with D001, D002, and D003 codes will be processed or repackaged prior to shipment to WIPP per Geoff Asmus. According to the Building 774 Second-Stage Treatment Log (January 1981 to October 1989), prior to September 1984, the Building 774 aqueous waste treatment system received waste streams that are treated in the Building 374 Liquid Waste Treatment Facility. These streams affected the characterization of Building 774 solidified sludge until September 1985. The choice of the transition date of September 1984 is discussed in detail under the Subpopulation 55A discussion in the Backlog Baseline Book prepared by Rocky Flats.

Information contained in the November 1992 WSRIC Valve Vaults Book has been used to characterize waste streams treated in Building 774 prior to September 1984. The Valve Vaults book describes the process waste sent to Building 374 for treatment. The book was used because it is the only reference that provides detailed characterization information on waste that was sent to Building 774. Other references and interviews have been used to enhance or add to this information as it relates to the waste form.

Management Comments N/A

Acceptance Comments RFP has assumed this waste to be LDR based on process knowledge characterization and limited analytical data.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream consists of a cemented solid, with some free liquids. It can also have some small chunks in it.

Waste Stream Source Description Solidified organics are cemented waste oils and solvents that were generated as a result of machining and tool degreasing. Waste oil was transferred primarily from Buildings 707 and 777. Cementation was performed in Waste Management Unit (WMU) 56, Room 210, Building 774. The earliest generation date for the backlog inventory is June 1984. The Organic and Sludge Immobilization System (OASIS) Process generating solidified organics stopped in January 1990. These containers are assigned IDC 0003 and 0801.

Solidified organics waste currently stored at Rocky Flats was generated by the Grease Plant Process or the OASIS Process. The Grease Plant Process operated until November 1985. The OASIS Process began operating in November 1985. The last OASIS runs occurred in 1991.

Tanks T-1 and T-2, Tank T-374A, and Tanks T-13 and T-14 have all received waste oils and solvents for treatment at various times. The waste oils and solvents were generated primarily by processes in Buildings 707 and 777. Solvent-contaminated waste oils were generated by plutonium machining and tool degreasing. Ultrasonic cleaners consisting of trichloroethane baths were used to clean parts. Buildings 707 and 777 also cleaned metal turnings and scrap in carbon tetrachloride baths before forming them into briquettes.

Laboratory wastes in bottles were poured into containers of solidified organics in the past. Laboratory waste contaminants included organophosphates and nitrobenzene. According to the generator, bottled laboratory wastes were poured into five or fewer solidified organics containers. However, there is no documentation specifying the individual drums.

The majority of wastes fed to the solidified organics generation processes consisted of plutonium-contaminated oils and solvents. A cutting oil, usually Texaco Regal "A," flowed onto a part during machining. After machining, the part was rinsed to remove residual oil. Various solvents were used to rinse machined parts and degrease tools. These included trichloroethylene and tetrachloroethylene. According to the generator, trichloroethylene and tetrachloroethylene use stopped in 1973.

Spent carbon tetrachloride and trichloroethane from cleaning baths were also fed to the solidified organics generation processes. Parts for assembly from Buildings 707 and 777 were cleaned in ultrasonic wash tanks before welding. The tanks contained 15 gallons of trichloroethane. In another cleaning process, metal turnings and scraps were placed into perforated metal baskets and dipped into a series of tanks containing carbon tetrachloride. Each of the steel tanks held 4 gallons of solvent. The cleaned metal was then formed into briquettes. Carbon tetrachloride and trichloroethane baths were replaced periodically.

Waste oil and solvents were drained and pumped into storage tanks. The wastes were then filtered to recover the actinides. After filtering, the plutonium and uranium concentrations in the waste were measured. If the concentrations were above specified transfer limits, the waste was refiltered in the Ful-Flo filtration system. When the concentrations of plutonium and uranium were below transfer limits, the waste was transferred to the solidified organics generation processes in Building 774.

Tanks T-1 and T-2, Tank T-374A, and Tanks T-13 and T-14 received waste oils from the same processes in Buildings 707 and 777. Tanks T-1 and T-2 fed waste oils to the Grease Plant Process and the OASIS Process. Tank T-374A began feeding waste oils to the OASIS Process after damage to Tanks T-1 and T-2 was identified and they were removed from operation. Tanks T-13 and T-14 began feeding waste oils after Tank T-374A. Tanks T-374A, T-13, and T-14 were used simultaneously until Tank T-374A was removed from operation. Tanks T-13 and T-14 continued feeding the OASIS Process until it stopped in January 1990.

In the Grease Plant Process, waste oil and Microcel E (calcium silicate) were fed separately into a continuous mixer. Small amounts of Oil Dri were sometimes added to the mixture as well. The amounts of materials added to the mixture were not metered. However, the operator would adjust the composition if the outgoing mixture did not have a paste-like consistency. The mixture would then drop into an O-ring bag contained in a 55-gallon drum. Drums of solidified organics from the Grease Plant Process were subsequently transported to the Size Reduction Facility in Building 776 for inspection and sealing.

OASIS was a batch-type process generating one drum per run. Waste oils were pumped into an O-ring bag contained in a 55-gallon drum attached to the

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT0801

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

bottom of the OASIS glovebox. Envirostone emulsifier, gypsum cement, and accelerator were also metered into the bag. House water, which had not been used in any other processes, was added to the mixture as well. A Lightning Mixer was lowered into the drum after all of the materials were added. The amount of materials added to the mixture was operator controlled.

The drums were transferred to WMU 73, Room 241, after they had been inspected and sealed. Solidified organics containers from the OASIS process were stored in Building 774 until they were transferred to Building 371 for nondestructive assay (NDA). After RTR, drums were usually sent to Building 664, where they were stored until shipment off site. Solidified organics waste is not being shipped at this time. Consequently, Building 664 has reached capacity and solidified organics are also being stored in Buildings 371, 569, 774, and 776.

Current Container Comments N/A

EPA Comments Solidified organics were generated by the OASIS process after November 11, 1985.

Analytical information regarding solidified organics was not found in the WSRIC Sampling and Analysis database. However, non-WSRIC analytical data from 1988 and 1989 are considered in the characterization of the waste. The analytical method was not specified for the results. However, Toxicity Characteristic Leaching Procedure (TCLP) analysis was not typically performed in 1988 and 1989. The results are assumed to be from Totals analysis. Validated headspace analysis performed on drums containing solidified organics are considered as well. Headspace analytical results support the 1988 and 1989 results from sampling and analysis.

Wastes received by Tanks T-1 and T-2, T-374A, and T-13 and T-14 were intermittently contaminated with Resource Conservation and Recovery Act (RCRA) organics. Carbon tetrachloride (D019), nitrobenzene (D036), and trichloroethylene (D040) were cited contaminants. Nitrobenzene was a contaminant in nonroutine laboratory waste and was introduced into five or fewer drums. Contaminated drums could not be identified. However, the solidified organics population, as a whole, does not exhibit the toxicity characteristic for nitrobenzene.

Sampling and analysis of three solidified organics samples in 1988 and 1989 indicated the waste exceeded toxicity characteristic criteria for carbon tetrachloride (EPA Code D019). The waste did not exceed toxicity characteristic criteria for any of the other cited RCRA organics. TCLP analysis of the waste under EPA SW-846 is required to support the analytical results and confirm the assumptions.

Based on the "mixture" rule and the "derived-from" rule, solidified organics would carry the listed EPA codes associated with the wastes fed to the solidified organics generation processes. EPA Codes F001 and F002 are assigned to all solidified organics because wastes received by Tanks T-1 and T-2, T-374A, and T-13 and T-14 were contaminated with regulated spent solvents in the past.

Sampling and analysis of solidified organics waste in 1988 and 1989 indicated the waste exceeded the F001 and F002 LDR treatment standards for carbon tetrachloride and 1,1,1-trichloroethane. The analyses found detectable concentrations of other F001 and F002 constituents, as well. Total analysis of the waste under EPA SW-846 is required to confirm these results.

P- and U-listed EPA codes for discarded commercial chemical products will not be assigned to solidified organics. Excess chemicals are stored on the plant site. However, there is no documentation supporting P- and U-listed waste codes for specific chemicals that were disposed of in process waste. Cited laboratory chemicals like nitrobenzene were used for their intended purpose as reagents and were not discarded commercial chemical products.

Management Comments N/A

Acceptance Comments RFP has assumed this waste to be LDR based on process knowledge characterization, and one sample analyzed for volatiles in 1988.

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. The waste is stored in 55-gallon carbon steel drums with a rigid polyethylene liner and one or two bag liners.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream represents the solidified final form of all particulate and sludge type materials. Particulates and sludge type materials are immobilized with Portland cement. The cemented wastes are cast into 1-gallon molds and allowed to cure prior to packaging. This is the final waste form for Firebrick, Pulverized or Fines/TRM (RF-W036), Incinerator Ash/TRM (RF-W040), Particulate Sludge/TRM (RF-W068), and Sand, Slag, and Crucible/TRM (RF-W059). IDC 806 - All inorganic particulate and inorganic sludge waste must be immobilized by processing into a solid and identified as IDC 806.

Waste Stream Source Description This is a new waste stream and includes IDC 806 only. It represents the solidified final form of Firebrick, Pulverized or Fines/TRM (RF-W036), Incinerator Ash/TRM (RF-W040), Particulate Sludge/TRM (RF-W068), and Sand, Slag, and Crucible/TRM (RF-W059). Particulates and sludge type materials are immobilized with Portland Cement. The cemented wastes are cast into 1-gallon molds and allowed to cure prior to packaging.

There is currently no inventory of this waste at Rocky Flats. However, generation of this waste is expected as the plant progresses in its mission of environmental cleanup and waste management. Therefore, some IDC 806 material is expected to be generated in the 20-year horizon as waste management and disposal activities continue. For these reasons, this waste must be reported in the Baseline Inventory Report; it is included here to maintain consistency between this report and the BIR.

Current Container Comments N/A

EPA Comments All waste with D001, D002, and D003 codes will be processed or repackaged prior to shipment to WIPP per Geoff Asmus. The characterization basis for this waste is to apply EPA hazardous waste numbers from the four feed materials identified above that would be expected to apply to the final solidified waste form as well. These are projected hazardous waste numbers and may not apply after the waste is generated and analytical work completed.

Projected list of contaminants based on those present in source wastes.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is a solid cemented sludge. It could have small amounts of free liquids in the bottom of the container.

Waste Stream Source Description Aqueous sludge wastes assigned IDCs 001 and 800 were generated by the high-level aqueous waste treatment system in Building 774. IDC 001 was replaced by IDC 800 in 1986.

A two-stage basic waste treatment, precipitation, and filtration process generates IDCs 001 and 800 aqueous sludge. Acidic wastes are neutralized with sodium hydroxide in stage one. Ferric sulfate and Purifloc flocculant are added to the neutralized waste (containing metal ions) to precipitate the sludge prior to filtration. In stage two, ferric sulfate, magnesium sulfate, calcium chloride, and Purifloc flocculant are added to basic wastes during the two-stage treatment to precipitate sludge. The sludge slurry from the acidic and basic waste treatment is drawn through a diatomite filter media on a rotating drum filter to trap the solids. The filter media and sludge are continuously scraped off the drum filter and co-fed into a 55-gallon drum with additional diatomite and Portland cement making up the solidification process. No mechanical mixing of the sludge and cement is performed.

Prior to 1979, IDC 001 consisted of sludge from the first-stage treatment only. When the first- and second-stage sludges were packaged separately, two vacuum filters were used. From 1979 to 1986, IDC 001 was a combination of the sludges from the first- and second-stage treatment processes. The sludge was produced chemically in the same fashion aqueous waste was treated to produce IDC 800 sludge. The solidification process for IDC 001 differs from the IDC 800 method of adding cement and diatomite as the sludge collects. Portland cement was added to the bottom of the IDC 001 drum prior to placing the sludge in the drum. In some cases additional Portland cement was added on top of the sludge.

Prior to September 1984, Building 774 accepted many aqueous process wastes from other buildings. These wastes, now piped to Building 374, were treated as described above. The accepted wastes included aqueous waste from Buildings 122, 123, 444, 559, 707, 776, 778, 779, 865, 881, 883, 889. After August 1984 and the start-up of the Building 374 Precipitation Process, only waste piped from Building 771 (stream condensate, scrubber waste, ion column effluent, and process waste sinks), waste in containers from various buildings, and wastes generated within Building 774 (silver recovery effluent, seal liquid, and floor washdown) were accepted. From 1986 through 1989, the treatment process treated from 150,000 gallons to over 500,000 gallons per year and generated 2,700 drums of IDCs and 800 sludge.

See Solidified Bypass Sludge/LLM for detailed descriptions of IDCs 007, 803, and 807.

Current Container Comments N/A

EPA Comments All waste with D001, D002, and D003 codes will be processed or repackaged prior to shipment to WIPP per Geoff Asmus. According to the Building 774 Second-Stage Treatment Log (January 1981 to October 1989), prior to September 1984, the Building 774 aqueous waste treatment system received waste streams that are treated in the Building 374 Liquid Waste Treatment Facility. These streams affected the characterization of Building 774 solidified sludge until September 1985. The choice of the transition date of September 1984 is discussed in detail under the Subpopulation 55A discussion in the Backlog Baseline Book prepared by Rocky Flats.

Information contained in the November 1992 WSRIC Valve Vaults Book has been used to characterize waste streams treated in Building 774 prior to September 1984. The Valve Vaults book describes the process waste sent to Building 374 for treatment. The book was used because it is the only reference that provides detailed characterization information on waste that was sent to Building 774. Other references and interviews have been used to enhance or add to this information as it relates to the waste form.

Management Comments N/A

Acceptance Comments RFP has assumed this waste to be LDR based on process knowledge characterization and limited analytical data.

TWBIR ID: RF-MT-0823

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists of sludge type material. It is a semi-fluid material. Some of it has had cement added to it to try to solidify it.

Waste Stream Source Description Item Description Code 292-Incinerator Sludge

IDC 292 was intended for incinerator sludge from the recovery incinerator in Building 771. IDC 292 materials were reassessed under Waste Form 1, Incinerator Ash. However, there is one box WEMS incorrectly assigned this IDC. According to the waste-box log sheet dated October 14, 1987, the box contains Electrochemical Milling Sludge generated in Building 881. This operation generated sludge from the milling of various metals including stainless steel. It was indicated that no cyanides were used in the ECM operations in Building 881. The IDC for this box should be changed to 299.

Item Description Code 299-Miscellaneous Sludge

This IDC has been used for sludges that were not accurately categorized as IDC 290 or 340 and could have been generated in any plutonium processing building. However, the backlog miscellaneous sludge was generated in Building 771 during the processing of residues, in Building 371 in the analytical laboratory, and in Building 883 by the Rolling Process. Process pipe sludge, sludge dissolution heel, and filter plenum sludge from Building 771 were processed through nitric acid dissolution and sparging. Soil and sludge samples from around the site were analyzed in Building 371, and the waste was stored for processing. IDC 299 materials generated in Building 883 include quench sludge and uranium oxide sludge from the Rolling Process. This group also includes one container of electrochemical milling sludge generated in Building 881 in October 1987. The container is assigned IDC 292.

Item Description Code 372-Grit

This IDC was generated by grit blasting operations in Building 371 (primarily for cleaning steel and iron) and Building 777 in the Machining and Coating processes (primarily cleaning shields). A variety of materials were used for the grit, including iron shot, walnut shells, glass beads, and ceramic beads. The majority of the grit is thought to be iron shot ranging in size from fines to irregular particles. There were apparently no other RCRA-regulated metals involved in the grit blasting. There is one drum of IDC 372 shown in WEMS as being generated in Building 371. However, no grit blasting operation could be identified in that building.

Item Description Code 823-Cemented Sludge

IDC 823, cemented miscellaneous sludge, was generated when sludge designated as inorganic particulate and sludgy material that was below the economic discard limit (EDL) was placed in 1-gallon paint cans and covered with Portland cement or mixed with cement into a block. The first scenario was conducted in Building 771 and the second in Building 371. This could have included IDCs 290-299 and was done to meet the Waste Isolation Pilot Plant (WIPP) waste acceptance criteria. The material came primarily from Nash pumps in Building 771 and included vacuum grease and oily sludge. One drum of the material was apparently generated when the pit in front of Building 707 was cleaned out. However, the contents of the pit sludge could not be ascertained. One drum was generated in the Size Reduction Vault in Building 776. Six drums were generated in Building 774 and are stored in Building 371. Drum-specific information was requested but was not received. The drums from Building 559 are incorrectly assigned IDC 823 in WEMS. The drums are stored in Building 771 and are labeled with IDC 863. It appears that IDC 823 was entered incorrectly in WEMS. Therefore, these drums should be changed to IDC 863 in WEMS.

This waste form is generated from Facility/Equipment Operation, Maintenance, Analytical Laboratories, R&D Laboratories, D&D, and limited Emergency Response actions.

Current Container Comments N/A

EPA Comments Subpopulation 46MX includes IDC 823, cemented miscellaneous sludge, generated in Building 371. The waste in this subpopulation was originally characterized as hazardous miscellaneous sludge (IDC 299). Building 371 Residue Project personnel visually inspected the material and determined the waste to be cemented sludge. Since the primary function of Building 371 was plutonium recovery, it is assumed the processes that generated this cemented sludge

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT-0823

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

were similar to the plutonium recovery processes in Building 771 (see Subpopulation 46GB). Therefore, EPA Hazardous Waste Numbers D006, D007, D008, F001, F002, and F005 are also applied to this waste.

Management Comments N/A

Acceptance Comments 1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. WASTE_PACK: The waste is packaged in 55-gallon drums with multiple bag liners. These are typically smaller containers within the drums.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Polymerized organics - drum consists of 55-gallon drum quantities of organic liquids solidified with polymer such as Nochar Petrobond.

Waste Stream Source Description N/A

Current Container Comments N/A

EPA Comments EPA hazardous waste numbers are assigned to this waste stream based on process knowledge.

Management Comments New Waste Stream being added to TWBIR

Acceptance Comments N/A

Final Form Comments N/A

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists of rags, paper, cloth, coveralls, plastic, rubber, and wood. The waste consists mainly of cloth and paper products from cleanup of gloveboxes and spills. The bulk of these wastes are packaged in 55-gallon drums with one rigid polyethylene liner and several bag liners. In addition, the waste may be packaged in DOT 7A Type A metal boxes which are lined with a fiberboard liner and a PVC liner or standard TRUPACT-II container. The containers are then assayed and transferred to interim status storage areas. These wastes have been shipped to the INEL for storage in the past. RF-330, 356, 337, 821, 822, 853, 831, 832, 833. Predominantly combustible debris.

Waste Stream Source Description Combustible wastes were produced by materials-handling and cleanup from production, research and development, laboratory, utility, custodial and maintenance activities. The combustible wastes form includes wipes, gloves, paper and plastics.

Item Description 330, Combustibles, Dry

IDC 330 is Dry Combustibles. This IDC is dry combustibles such as cloth, paper, and wood. This IDC changes to 821, 831, 851, or 861 at the point of assay, depending on radiological content. Containers of IDC 330 currently in inventory were generated in all buildings handling fissile material.

Item Description 336, Combustibles, Wet

Wet combustibles are paper, cloth, etc., which contain a discernible amount of moisture and must be drained or wrung out prior to packaging to prevent an accumulation of free liquid. This IDC changes to 822, 832, 852, or 862 at the point of assay.

Item Description 337, Plastic (Teflon, PVC, Polyethylene)

IDC 337 represents PVC sheeting, poly bottles, supplied-air suits, polyethylene, and other plastics. IDC 337 changes to 825, 833, 853, or 863 at the point of assay.

Item Description 821, Combustibles, Dry TRU Waste

Dry transuranic combustible wastes, such as paper, cloth, and wood are classified as IDC 821.

Item Description 822, Combustibles, Wet TRU Waste

Wet combustible transuranic wastes, such as paper, cloth, and wood, which contain a discernible amount of moisture must be drained or wrung out prior to packaging to prevent accumulation of free liquid. These wastes are classified as IDC 822.

Item Description 831, Combustibles, Dry, TRU Mixed Waste

Dry combustibles such as paper, cloth, wood, etc. This waste has been identified as being low level mixed waste.

Item Description 832, Combustibles, Wet, TRU Mixed Waste

Wet combustibles such as paper, cloth, and wood which contain a discernible amount of moisture. These combustibles must be drained or wrung prior to packaging to prevent accumulation of free liquid.

Item Description 833, Plastic TRU Mixed Waste

PVC sheeting, poly bottles, supplied air suits, and other plastics. This waste has been identified as being a low level mixed waste.

Item Description 853, Plastic (Teflon, PVC, and Polyethylene)

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-MT0831

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

This waste has been identified as being a low level mixed waste, consisting of PVC sheeting, poly bottles, supplied-air suits, and other plastics.

Current Container Comments N/A

EPA Comments A- Process knowledge based upon general knowledge of waste type or source (e.g., there is some probability of a waste constituent being absent or present).

Bounding analytical data have not been compiled in a form that is compatible with this report. This effort has been completed and the results are available in the Final Backlog Baseline Book dated September 26, 1994.

Management Comments N/A

Acceptance Comments GENERAAREA: Numerous locations throughout RFP.GENOPERATI: RECLASS_CO: Rocky Flats assays wastes to determine waste type instead of relying on process knowledge or historical data. For this reason, the potential for reclassification has not been analyzed.CATION: Not applicable
OTHER_CHAR: No information available.

RFP has assumed this waste to be LDR based on process knowledge characterization, and one sample analyzed for volatiles in 1988.

1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. Analytical data are limited. WASTE_PACK: This waste is stored in 55 gallon carbon steel drums with one rigid polyethylene liner and several bag liners and standard metal boxes.

Final Form Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	Matrix consists of crushed glass light bulbs.
Waste Stream Source Description	<p>Item Description Code 444--Ground Glass and Leaded Glovebox Glass</p> <p>This IDC includes ground fluorescent bulbs and leaded glass used throughout the plutonium-and uranium-processing areas. The material was generated as waste or residue when glovebox glass was replaced, or as low-level waste when fluorescent light bulbs were replaced. IDC 444 materials in the backlog inventory were generated in Building 371, 374, 559, 707, 771, and 776.</p> <p>Item Description Code 855--Ground Glass</p> <p>This IDC includes ground glass from fluorescent light bulbs. It can be used for waste generated outside the PA and for nonline-generated waste. In other words, it can only be used for low-level mixed waste.</p>
Current Container Comments	N/A
EPA Comments	Analytical data for IDC 855 show that there are enough cases where the samples fail the Toxicity Characteristic Leaching Procedure (TCLP), that the waste bulbs should be managed as hazardous waste and assigned the EPA code D009.
Management Comments	N/A
Acceptance Comments	<p>LDR_DETERM: Net and gross weight data are not available for all container types.</p> <p>RFP has assumed this waste to be LDR based on the fact that it is a RCRA listed waste.</p> <p>1. Basis for determining LDR storage prohibition status is based primarily on process knowledge. WASTE_PACK: The glass waste is packaged in 55- gallon drums that are lined with one fiberboard liner and two polyethylene bags or metal boxes. Drums are placed in TRUPACT II containers.</p>
Final Form Comments	N/A

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	This waste consists of cloth and paper products from cleanup of gloveboxes and spills, which has been supercompacted for volume reduction.
Waste Stream Source Description	<p>Item Description Code 2116 - IDC 2116 is Supercompacted TRU-mixed combustible waste (IDCs 831, 832, and 833). Refer to Waste Form RF-W012 for details of these IDCs. Containers of IDC 2116 were generated in Building 776. The WSRIC stream number is 776-13-40 (a/o 3/2/95).</p> <p>Soft wastes are inspected for rejectable items, including free liquids and metal, which are separated from the soft waste for further disposition. Soft wastes are moved to the precompactor where they are placed in an empty 35-gallon drum located in the precompactor. The soft waste is precompacted using a 30-ton precompactor.</p> <p>Once the drum is filled with precompacted waste, the lid is placed on the drum. The drum is transferred to the appropriate glovebox line for piercing. Prior to supercompaction, drums of soft waste are pierced with four holes to allow air to escape and to reduce the amount of "springback" during supercompaction. After piercing, the drums are moved to the supercompactor. A mold is lowered over the drum. Once the mold is in place, the supercompactor is lowered, compacting the drum. Liquid forced out of the waste during compaction is collected by the liquid waste collection system.</p> <p>After supercompaction, the pucks (supercompacted 35-gallon drums) are moved to staging. An operator selects from the available pucks to efficiently fill 55-gallon loadout drums.</p>
Current Container Comments	N/A
EPA Comments	<p>Subpopulation 52NW consists of super compacted combustible waste (IDC 2116) from generation prefix 0057. These wastes are characterized in WEMS as hazardous with EPA codes F001 and F002. According to the container paperwork, these containers were originally characterized under WSRIC process descriptions 776-13-1 or 776-13-40 (Supercompactor Process). WSRIC process description 776-13-1 was written for samples and therefore does not include any characterization information. WSRIC process description 776-13-40 includes several other EPA codes in addition to F001 and F002. However, it states in the characterization rationale for this WSRIC that codes are listed for all possible contaminants and that the actual EPA codes to be applied are indicated in the W/RT and/or WEMS for individual containers. There is no information available to refute the characterization provided in WEMS. Therefore, this waste is characterized as hazardous and EPA codes F001 and F002 are retained.</p> <p>Subpopulation 52NX consists of super compacted combustible waste (IDC 2116) from generation prefix 0057. These wastes are characterized in WEMS with EPA Codes D007, D008, F001, F002, and F005. No container information is available to support or refute this characterization, so the EPA codes have been retained and these wastes are characterized as RCRA hazardous. They are assumed to exhibit the characteristic of toxicity for chromium and lead and to be contaminated with unspecified F001, F002, and F005 solvents. These wastes have probably come into contact with paint and paint thinner.</p>

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description "Blended incinerator ash consists in all or part of the following IDCs: pulverized incinerator ash (IDC 420), ash heel (IDC 421), soot (IDC 422), , and ash selected for MMEC (IDC 428). These IDCs are blended together to adjust plutonium content and container fill height. When low plutonium content feedstock for blending is unavailable, a surrogate material may be used."

Waste Stream Source Description N/A

Current Container Comments N/A

EPA Comments EPA hazardous waste numbers are assigned to this waste stream based on process knowledge and confirmed by WIPP characterization sampling and analysis.

Management Comments New Waste Stream being added to TWBIR

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste form includes graphite chunks and coarse graphite .

Waste Stream Source Description Item Description Code 300, Graphite Molds

During the casting of plutonium in production foundry operations, the plutonium casting operations in Building 707 generated used graphite molds. The working surfaces were coated with calcium fluoride prior to using the mold. After the plutonium casting was removed from the mold, the molds were collected in a drum. Drums that contained recoverable amounts of plutonium were stored for subsequent scarfing of molds.

Item Description Code 301, Classified Graphite Shapes

During the casting of plutonium in production foundry operations, classified molds are segregated from nonclassified molds. Prior to 1984, the classified molds were destroyed in Building 776.

Item Description Code 303, Scarfed Graphite Chunks

After the casting of plutonium in production foundry operations, IDCs 300 and 301 were mechanically cleaned using a hand-held rotary-type sanding tool to grind off contamination in Buildings 371, 707, 771, and 777, generating Scarfed Graphite Chunks. The mechanical cleaning (scarfing) of the mold surface removes most of the mold coating and plutonium contamination. This process generated IDC 303 and 310, as well as IDC 312.

Item Description Code 310, Graphite Scarfing and Fines

After the casting of plutonium in production foundry operations, IDC 300 was mechanically cleaned in Buildings 371, 707, 771, and 777, generating graphite scarfings and fines. The mechanical cleaning (scarfing) of the mold surface removes most of the mold coating and plutonium contamination. Material generated in this process were fines and small pieces of graphite coated with calcium fluoride and plutonium. This material was then subjected to nondestructive assay to determine actinide content, and collected for disposition.

Item Description Code 312, Graphite Coarse

After the casting of plutonium in production foundry operation, IDC 300 was mechanically cleaned in Buildings 371, 707, 771, and 777, generating coarse graphite. Material generated in this process was chunk pieces of graphite produced as a by-product of IDC 310 generation.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists of Benelex shielding and Plexiglass glovebox windows.

Waste Stream Source Description IDC 302 includes Benelex and Plexiglas. Benelex is a very dense organic material used for radiation shielding around gloveboxes and tanks. In some cases, Benelex is laminated with lead. However, none of the containers identified here have lead lamination. The Benelex used by RFETS is usually 2 inches thick, although occasionally two 2-inch thick pieces were bolted together to increase shield thickness. Plexiglas is a trade name used to describe a family of polycarbonate materials used for radiation shielding in glovebox windows and equipment enclosures. Plexiglas glovebox windows are generally 2- to 4-inches thick and can be in various sizes and shapes.

Benelex and Plexiglas in the inventory were generated in Buildings 371, 707, 771, and 776. The IDC was generated as waste during replacement of shielding or stripout of unnecessary shielding during the installation of new gloveboxes or tanks.

IDC 330 is dry combustibles such as cloth, paper, and wood. This IDC changes to 821, 831, 851, or 861 at the point of assay, depending upon radiological content

IDC 336, wet combustibles, are materials such as, paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent an accumulation of free liquid. This IDC changes to 822, 832, 833, or 862 at the point of assay.

IDC 337 is PVC sheeting, poly bottles, supplied-air suits, polyethylene, and other plastics. This IDC changes to 825, 833, 853, or 863 at the point of assay.

IDC 487 is classified plastic shapes used in handling and shipping. If TRU, shapes must be declassified prior to shipment. If LLW, IDC must be authorized by NTS prior to shipment. Classified Waste drums must be stenciled and handled according to Safeguards and Security procedures.

IDC 821 is dry combustibles such as paper, cloth, and wood.

IDC 822 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

ICD 825 is PVC sheeting, poly bottles, supplied-air suits, and other plastic.

IDC 831 is dry combustibles such as paper, cloth, and wood.

IDC 832 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

IDC 833 is PVC sheeting, poly bottles, supplied-air suits, and other plastics.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	This waste form includes graphite chunks and coarse graphite .
<hr/>	
Waste Stream Source Description	<p>Item Description Code 300, Graphite Molds</p> <p>During the casting of plutonium in production foundry operations, the plutonium casting operations in Building 707 generated used graphite molds. The working surfaces were coated with calcium fluoride prior to using the mold. After the plutonium casting was removed from the mold, the molds were collected in a drum. Drums that contained recoverable amounts of plutonium were stored for subsequent scarfing of molds.</p> <p>Item Description Code 301, Classified Graphite Shapes</p> <p>During the casting of plutonium in production foundry operations, classified molds are segregated from nonclassified molds. Prior to 1984, the classified molds were destroyed in Building 776.</p> <p>Item Description Code 303, Scarfed Graphite Chunks</p> <p>After the casting of plutonium in production foundry operations, IDCs 300 and 301 were mechanically cleaned using a hand-held rotary-type sanding tool to grind off contamination in Buildings 371, 707, 771, and 777, generating Scarfed Graphite Chunks. The mechanical cleaning (scarfing) of the mold surface removes most of the mold coating and plutonium contamination. This process generated IDC 303 and 310, as well as IDC 312.</p> <p>Item Description Code 310, Graphite Scarfing and Fines</p> <p>After the casting of plutonium in production foundry operations, IDC 300 was mechanically cleaned in Buildings 371, 707, 771, and 777, generating graphite scarfings and fines. The mechanical cleaning (scarfing) of the mold surface removes most of the mold coating and plutonium contamination. Material generated in this process were fines and small pieces of graphite coated with calcium fluoride and plutonium. This material was then subjected to nondestructive assay to determine actinide content, and collected for disposition.</p> <p>Item Description Code 312, Graphite Coarse</p> <p>After the casting of plutonium in production foundry operation, IDC 300 was mechanically cleaned in Buildings 371, 707, 771, and 777, generating coarse graphite. Material generated in this process was chunk pieces of graphite produced as a by-product of IDC 310 generation.</p>

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Typically, these scrap metals consist of crucibles, funnels, rods and fixturing from several processes and production operations. Tantalum, tungsten and platinum are examples of scrap metals at the RFP.

Waste Stream Source Description Heavy metals have been produced as by-products of Rocky Flats operations in Buildings 371, 707, 771, 776, 777, 779, and 865; they are identified by IDC 320. The IDC 320 heavy nonspecial source metal was generated in various locations throughout the Rocky Flats and is stored in Resource Conservation and Recovery Act (RCRA) Units 11, 12, 13, 15A, and 20. This IDC includes nonstainless-steel metals that are heavier than iron. Examples of this waste include crucibles, funnels, rods, and process fixtures. These items are made primarily from tantalum, tungsten, and platinum, but some parts could have been manufactured or contaminated with lead if the accumulation start date was prior to 1987. IDC 320 originally included lead.

During maintenance operations, the maintenance shop in Building 371 generated heavy metal vessels, instruments, rods, and plates fabricated from tantalum, tungsten, and platinum. The shop generated these items during 4 1/2 years of operation from 1983 until 1988. Of these containers in storage, 19 backlog containers have an EPA Code of D008 (lead); eight of these were produced after 1987. Building 707, Modules A and J, generated heavy metals in its foundry operations. These heavy metals were primarily crucibles and pans used for presampling. These processes generated material during 6 1/2 years of operation from 1985 until 1991. Nine backlog containers have an EPA Code of D008 (lead). The plutonium recovery operations in Building 771 generated leached Oralloid parts consisting of tantalum, tungsten, and platinum. The system generated material during 3 years of operation from 1987 until 1990. Five backlog containers have an EPA Code of D008 (lead); Four of these backlog containers were produced after 1987. Building 776, Pyrochemical Processing, generated material during heel processes. Eight containers have an EPA Code of D008 (lead). Building 777, the Coatings Laboratory, generated material during a 2-year period of operation from 1988 until 1990. This material consists primarily of various heavy metals used in the research and development of coating technologies. These backlog containers have been associated with lead as a constituent and were produced after 1987. The Residue Treatment Technology Group, Building 779, generated crucibles, stirrers, and other general lab equipment derived from tantalum and tungsten. In Building 779, the Physical Metallurgy Group generated tantalum materials used in casting and cast testing. Additionally, the Surface Analysis Laboratory in Building 779 generated heavy metal samples primarily of depleted uranium (D-38). IDC 320 material was produced by Building 779 operations over a 10-year period from 1981 until 1991. Nine backlog containers have an EPA Code of D008 (lead), six were produced after 1987.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists mainly of cloth and paper products from cleanup of gloveboxes and spills.

Waste Stream Source Description IDC 302 includes Benelex and Plexiglas. Benelex is a very dense organic material used for radiation shielding around gloveboxes and tanks. In some cases, Benelex is laminated with lead. However, none of the containers identified here have lead lamination. The Benelex used by RFETS is usually 2 inches thick, although occasionally two 2-inch thick pieces were bolted together to increase shield thickness. Plexiglas is a trade name used to describe a family of polycarbonate materials used for radiation shielding in glovebox windows and equipment enclosures. Plexiglas glovebox windows are generally 2- to 4-inches thick and can be in various sizes and shapes.

Benelex and Plexiglas in the inventory were generated in Buildings 371, 707, 771, and 776. The IDC was generated as waste during replacement of shielding or stripout of unnecessary shielding during the installation of new gloveboxes or tanks.

IDC 330 is dry combustibles such as cloth, paper, and wood. This IDC changes to 821, 831, 851, or 861 at the point of assay, depending upon radiological content

IDC 336, wet combustibles, are materials such as, paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent an accumulation of free liquid. This IDC changes to 822, 832, 833, or 862 at the point of assay.

IDC 337 is PVC sheeting, poly bottles, supplied-air suits, polyethylene, and other plastics. This IDC changes to 825, 833, 853, or 863 at the point of assay.

IDC 487 is classified plastic shapes used in handling and shipping. If TRU, shapes must be declassified prior to shipment. If LLW, IDC must be authorized by NTS prior to shipment. Classified Waste drums must be stenciled and handled according to Safeguards and Security procedures.

IDC 821 is dry combustibles such as paper, cloth, and wood.

IDC 822 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

ICD 825 is PVC sheeting, poly bottles, supplied-air suits, and other plastic.

IDC 831 is dry combustibles such as paper, cloth, and wood.

IDC 832 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

IDC 833 is PVC sheeting, poly bottles, supplied-air suits, and other plastics.

TWBIR ID: RF-TT0335

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Glovebox HEPA filters.

Waste Stream Source Description Item Description Code 338-Filter Media

The material in this IDC is either the filter media portion of HEPA filters or surface-water filter. HEPA filters are used on gloveboxes and in large filter plenums. Sock filters were used to prefilter operable unit 2 (OU-2) surface water prior to activated carbon treatment.

IDC 338 filter media in this backlog population was derived from HEPA filters from Buildings 371, 374, 559, 707, 771, 776, and from surface-water filters used in OU-2. The HEPA filters could have originally been assigned IDCs 335, 342, 490, 491, or 492. Filter media from building 374 could have been generated from HEPA filters used in saltcrete processing; therefore, they could be contaminated with RCRA metals and F-listed solvents and sludges. Filter media from Building 771 could have been used to filter nitric acid vapors. Analytical data on the OU-2 surface waters indicates the sock filters are contaminated with F-Listed constituents carbon tetrachloride, trichloroethylene, and tetrachloroethylene. Chloroform, 1,1-dichloroethene, and vinyl chloride were also detected in the influent water analysis.

Item Description Code-331 Ful-Flo filters Not From Incinerator

These Ful-Flo filters are in-line cartridge filters used throughout Rocky Flats to remove particulates from fluid streams and typically filter down to 5, 1, and 0.5 micron-sized particulates. Ful-Flo filters are used in various liquid systems that include nitric- and chloride-acid systems, such as those found in plutonium recovery operations; caustic systems, such as those found in utilities scrubbing; solvent systems using carbon tetrachloride in machining operations; water systems, such as steam cleaning; and condensate collection. These filters are also used in lubricant oil filtration.

Ful-Flo filters are poly-fiber-wound cartridges, about 10" long by 3.5" in diameter. Other fiber filters, such as R-6 pads, may be included in this IDC. R-6 pads are cloth filters, about sixteen inches in diameter, used to filter solids from nitric acid solutions. Therefore, backlog material in this IDC cannot be considered homogeneous. Filter elements are produced by combining a media blanket and spirally wound matrix yarn on an inner core. The filter elements might have a polypropylene cap on one end. Both the media blanket and matrix yarn can be cotton or polypropylene. The inner core material can be constructed of polypropylene, tinned steel, or stainless steel. Warehouse data from Rocky Flats indicate that the inner-core material is polypropylene.

During normal process operations, IDC 331 Ful-Flo filters in this backlog population were used to filter particulates from liquid waste streams in Buildings 371, 707, 771, 776, 777, and 779. These waste streams were primarily from filtration of caustic solutions in Building 371, the carbon tetrachloride system and oil systems, and from filtration of water and developer in Building 707. In Building 771, the primary waste streams filtered were anion column feed, potassium hydroxide, nitrate feed, spent nitric acid and hydrofluoric acid from the scrubber, eluate and effluent exiting the ion-exchange columns, floor pick-up solution, steam condensate, and miscellaneous aqueous solutions. Hydraulic oil and floor pick-up solution were filtered in Building 776. In Buildings 777 and 779, Ful-Flo filters were used in the carbon tetrachloride system for purification of Freon TF and for filtration of incoming waters.

Typically, Ful-Flo filters were placed on drying racks pending bag-out of a glovebox. Filters were not always dried before removal from the glovebox. Filters were then "bagged out" of the glovebox and placed in a second layer of plastic. Next, the filters were placed in a "Poly Bottle" or "Clam Shell" (hard plastic container), then placed in a double-lined drum.

These Ful-Flo filters may be contaminated with acids, bases, carbon tetrachloride, chromium, Freon, and oil. They may contain relatively small amounts of free liquids.

Item Description Code 335-HEPA Glovebox Filters, Not Acid Contaminated

The material in this IDC is High Efficiency Particulate Air (HEPA) filters used in ventilation systems at Rocky Flats. HEPA filters have been and are used in all of the buildings which contain plutonium processing activities. HEPA filters are used on gloveboxes and in large filter plenums that filter the room air.

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-TT0335

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Used filters were removed from their position in the ventilation system and packaged for further processing. The filters used on gloveboxes (nominal 8" x 8" x 5") were identified as IDC 335 if they were not acid contaminated.

Item Description Code 342-HEPA Glovebox Filters, Acid Contaminated

HEPA filters are used on all gloveboxes to remove particulates from the atmosphere exiting the glovebox to the plenum exhaust system. The filters in IDC 342 are from gloveboxes with atmospheres that could cause the filters to be contaminated with acids or bases used in chemical processing.

Item Description Code 491-Plenum Prefilters

The material in this IDC is a variety of plenum prefilters used in the ventilation systems at Rocky Flats. Plenum prefilters have been and are used in all of the buildings that contain plutonium processing activities. These prefilters are used in large plenums that filter the room and glovebox air. Used prefilters were removed from their position in the ventilation system and packaged for further processing.

IDC 491 plenum prefilters range from furnace-type filters to pleated fiberglass filters and can be as large as 24" x 24" x 12". The filter medium consists of fiberglass packing or paper which may be more or less dense, depending on filtering needs. Wire mesh can be used to hold the media in place. The frame material for these prefilters is cardboard.

Item Description Code 490--HEPA Filters (24" x 24"), Not Acid Contaminated

The material in this IDC is HEPA filters used in the ventilation systems at the RFETS. HEPA filters are used in all of the buildings that contain plutonium processing activities. These HEPA filters are used in large filter plenums that filter the room and glovebox air.

Used filters were removed from their position in the ventilation system and packaged for further processing. The larger-sized filters used in filters plenums were identified and packaged as IDC 490 if not acid contaminated.

IDC 490 HEPA filters (24" x 24"), not acid contaminated, are large HEPA filters (nominal 24" x 24" x 5 or 24" x 12) that were used in filter plenum racks. These filters consist of filter media contained within a wooden or metal frame.

The filter medium is composed of glass fibers, with a small percentage percentage of asbestos. An organic binder, elastomeric adhesive, or polyurethane sealant was use during construction. The medium also contains corrugated aluminum foil. The newer HEPA media will consist of glass and aromatic polyamide fibers (Nomex) and aluminum alloy metal coated with a thermoset vinly or epoxy. Various sealants could be present. The material will not be homogenous because of the different materials used in the different sizes and by the different manufacturers of the filters. The material in IDC 490 has not been contaminated with acid.

The frame material will be either 3/4", fire-retareant, exterior-grade plywood or wood-particle board and 14-gauge cadmium-plated or chromized carbon steel. neoprene, closed-cell, expanded rubber, precoated with a rubber-based adhesive is present on each filter.

More information on HEPA filters can be obtained from RFETS Standard SMU-401 (EG&G 1991).

The IDC 490 HEPA filters in this backlog population consist of filters from Buildings 374, 771, 774, 776, and 777. The majority of these filtes do not contain hazardous consitutents, although evaporated solvents may have been contacted. HEPA filters from Plenums 104A and 104B in Building 374 have contacted hazardous constituents from the Saltcrete Process.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists mainly of cloth and paper products from cleanup of gloveboxes and spills.

Waste Stream Source Description IDC 302 includes Benelex and Plexiglas. Benelex is a very dense organic material used for radiation shielding around gloveboxes and tanks. In some cases, Benelex is laminated with lead. However, none of the containers identified here have lead lamination. The Benelex used by RFETS is usually 2 inches thick, although occasionally two 2-inch thick pieces were bolted together to increase shield thickness. Plexiglas is a trade name used to describe a family of polycarbonate materials used for radiation shielding in glovebox windows and equipment enclosures. Plexiglas glovebox windows are generally 2- to 4-inches thick and can be in various sizes and shapes.

Benelex and Plexiglas in the inventory were generated in Buildings 371, 707, 771, and 776. The IDC was generated as waste during replacement of shielding or stripout of unnecessary shielding during the installation of new gloveboxes or tanks.

IDC 330 is dry combustibles such as cloth, paper, and wood. This IDC changes to 821, 831, 851, or 861 at the point of assay, depending upon radiological content

IDC 336, wet combustibles, are materials such as, paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent an accumulation of free liquid. This IDC changes to 822, 832, 833, or 862 at the point of assay.

IDC 337 is PVC sheeting, poly bottles, supplied-air suits, polyethylene, and other plastics. This IDC changes to 825, 833, 853, or 863 at the point of assay.

IDC 487 is classified plastic shapes used in handling and shipping. If TRU, shapes must be declassified prior to shipment. If LLW, IDC must be authorized by NTS prior to shipment. Classified Waste drums must be stenciled and handled according to Safeguards and Security procedures.

IDC 821 is dry combustibles such as paper, cloth, and wood.

IDC 822 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

ICD 825 is PVC sheeting, poly bottles, supplied-air suits, and other plastic.

IDC 831 is dry combustibles such as paper, cloth, and wood.

IDC 832 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

IDC 833 is PVC sheeting, poly bottles, supplied-air suits, and other plastics.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists mainly of cloth and paper products from cleanup of gloveboxes and spills.

Waste Stream Source Description IDC 302 includes Benelex and Plexiglas. Benelex is a very dense organic material used for radiation shielding around gloveboxes and tanks. In some cases, Benelex is laminated with lead. However, none of the containers identified here have lead lamination. The Benelex used by RFETS is usually 2 inches thick, although occasionally two 2-inch thick pieces were bolted together to increase shield thickness. Plexiglas is a trade name used to describe a family of polycarbonate materials used for radiation shielding in glovebox windows and equipment enclosures. Plexiglas glovebox windows are generally 2- to 4-inches thick and can be in various sizes and shapes.

Benelex and Plexiglas in the inventory were generated in Buildings 371, 707, 771, and 776. The IDC was generated as waste during replacement of shielding or stripout of unnecessary shielding during the installation of new gloveboxes or tanks.

IDC 330 is dry combustibles such as cloth, paper, and wood. This IDC changes to 821, 831, 851, or 861 at the point of assay, depending upon radiological content

IDC 336, wet combustibles, are materials such as, paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent an accumulation of free liquid. This IDC changes to 822, 832, 833, or 862 at the point of assay.

IDC 337 is PVC sheeting, poly bottles, supplied-air suits, polyethylene, and other plastics. This IDC changes to 825, 833, 853, or 863 at the point of assay.

IDC 487 is classified plastic shapes used in handling and shipping. If TRU, shapes must be declassified prior to shipment. If LLW, IDC must be authorized by NTS prior to shipment. Classified Waste drums must be stenciled and handled according to Safeguards and Security procedures.

IDC 821 is dry combustibles such as paper, cloth, and wood.

IDC 822 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

IDC 825 is PVC sheeting, poly bottles, supplied-air suits, and other plastic.

IDC 831 is dry combustibles such as paper, cloth, and wood.

IDC 832 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

IDC 833 is PVC sheeting, poly bottles, supplied-air suits, and other plastics.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This material consists of pieces ranging in size from 20" x 20" x 4" to 2" x 2" square pieces. These pieces are composed of glass fibers with a small percentage of asbestos. An organic binder, elastomeric adhesive, or polyurethane sealant was used during construction. The pieces also contain corrugated aluminum foil. The newer media consist of glass and aromatic polyamide fibers (Nomex) and aluminum alloy metal coated with a thermoset vinyl or epoxy. Various sealants could be present. The material is not homogenous because of the different materials used and the different manufacturers of the filters. IDC 338 could also contain R-4 filter pads from the dicesium hexachloraplutonate (DCHP) process. The pads are about 12-inch diameter cloth filters.

Waste Stream Source Description Item Description Code 338-Filter Media

The material in this IDC is either the filter media portion of HEPA filters or surface-water filter. HEPA filters are used on gloveboxes and in large filter plenums. Sock filters were used to prefilter operable unit 2 (OU-2) surface water prior to activated carbon treatment.

IDC 338 filter media in this backlog population was derived from HEPA filters from Buildings 371, 374, 559, 707, 771, 776, and from surface-water filters used in OU-2. The HEPA filters could have originally been assigned IDCs 335, 342, 490, 491, or 492. Filter media from building 374 could have been generated from HEPA filters used in saltcrete processing; therefore, they could be contaminated with RCRA metals and F-listed solvents and sludges. Filter media from Building 771 could have been used to filter nitric acid vapors. Analytical data on the OU-2 surface waters indicates the sock filters are contaminated with F-Listed constituents carbon tetrachloride, trichloroethylene, and tetrachloroethylene. Chloroform, 1,1-dichloroethene, and vinyl chloride were also detected in the influent water analysis.

Item Description Code-331 Ful-Flo filters Not From Incinerator

These Ful-Flo filters are in-line cartridge filters used throughout Rocky Flats to remove particulates from fluid streams and typically filter down to 5, 1, and 0.5 micron-sized particulates. Ful-Flo filters are used in various liquid systems that include nitric- and chloride-acid systems, such as those found in plutonium recovery operations; caustic systems, such as those found in utilities scrubbing; solvent systems using carbon tetrachloride in machining operations; water systems, such as steam cleaning; and condensate collection. These filters are also used in lubricant oil filtration.

Ful-Flo filters are poly-fiber-wound cartridges, about 10" long by 3.5" in diameter. Other fiber filters, such as R-6 pads, may be included in this IDC. R-6 pads are cloth filters, about sixteen inches in diameter, used to filter solids from nitric acid solutions. Therefore, backlog material in this IDC cannot be considered homogeneous. Filter elements are produced by combining a media blanket and spirally wound matrix yarn on an inner core. The filter elements might have a polypropylene cap on one end. Both the media blanket and matrix yarn can be cotton or polypropylene. The inner core material can be constructed of polypropylene, tinned steel, or stainless steel. Warehouse data from Rocky Flats indicate that the inner-core material is polypropylene.

During normal process operations, IDC 331 Ful-Flo filters in this backlog population were used to filter particulates from liquid waste streams in Buildings 371, 707, 771, 776, 777, and 779. These waste streams were primarily from filtration of caustic solutions in Building 371, the carbon tetrachloride system and oil systems, and from filtration of water and developer in Building 707. In Building 771, the primary waste streams filtered were anion column feed, potassium hydroxide, nitrate feed, spent nitric acid and hydrofluoric acid from the scrubber, eluate and effluent exiting the ion-exchange columns, floor pick-up solution, steam condensate, and miscellaneous aqueous solutions. Hydraulic oil and floor pick-up solution were filtered in Building 776. In Buildings 777 and 779, Ful-Flo filters were used in the carbon tetrachloride system for purification of Freon TF and for filtration of incoming waters.

Typically, Ful-Flo filters were placed on drying racks pending bag-out of a glovebox. Filters were not always dried before removal from the glovebox. Filters were then "bagged out" of the glovebox and placed in a second layer of plastic. Next, the filters were placed in a "Poly Bottle" or "Clam Shell" (hard plastic container), then placed in a double-lined drum.

These Ful-Flo filters may be contaminated with acids, bases, carbon tetrachloride, chromium, Freon, and oil. They may contain relatively small amounts of free liquids.

Item Description Code 335-HEPA Glovebox Filters, Not Acid Contaminated

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-TT0338

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

The material in this IDC is High Efficiency Particulate Air (HEPA) filters used in ventilation systems at Rocky Flats. HEPA filters have been and are used in all of the buildings which contain plutonium processing activities. HEPA filters are used on gloveboxes and in large filter plenums that filter the room air.

Used filters were removed from their position in the ventilation system and packaged for further processing. The filters used on gloveboxes (nominal 8" x 8" x 5") were identified as IDC 335 if they were not acid contaminated.

Item Description Code 342-HEPA Glovebox Filters, Acid Contaminated

HEPA filters are used on all gloveboxes to remove particulates from the atmosphere exiting the glovebox to the plenum exhaust system. The filters in IDC 342 are from gloveboxes with atmospheres that could cause the filters to be contaminated with acids or bases used in chemical processing.

Item Description Code 491-Plenum Prefilters

The material in this IDC is a variety of plenum prefilters used in the ventilation systems at Rocky Flats. Plenum prefilters have been and are used in all of the buildings that contain plutonium processing activities. These prefilters are used in large plenums that filter the room and glovebox air. Used prefilters were removed from their position in the ventilation system and packaged for further processing.

IDC 491 plenum prefilters range from furnace-type filters to pleated fiberglass filters and can be as large as 24" x 24" x 12". The filter medium consists of fiberglass packing or paper which may be more or less dense, depending on filtering needs. Wire mesh can be used to hold the media in place. The frame material for these prefilters is cardboard.

Item Description Code 490--HEPA Filters (24" x 24"), Not Acid Contaminated

The material in this IDC is HEPA filters used in the ventilation systems at the RFETS. HEPA filters are used in all of the buildings that contain plutonium processing activities. These HEPA filters are used in large filter plenums that filter the room and glovebox air.

Used filters were removed from their position in the ventilation system and packaged for further processing. The larger-sized filters used in filter plenums were identified and packaged as IDC 490 if not acid contaminated.

IDC 490 HEPA filters (24" x 24"), not acid contaminated, are large HEPA filters (nominal 24" x 24" x 5 or 24" x 12) that were used in filter plenum racks. These filters consist of filter media contained within a wooden or metal frame.

The filter medium is composed of glass fibers, with a small percentage of asbestos. An organic binder, elastomeric adhesive, or polyurethane sealant was used during construction. The medium also contains corrugated aluminum foil. The newer HEPA media will consist of glass and aromatic polyamide fibers (Nomex) and aluminum alloy metal coated with a thermoset vinyl or epoxy. Various sealants could be present. The material will not be homogenous because of the different materials used in the different sizes and by the different manufacturers of the filters. The material in IDC 490 has not been contaminated with acid.

The frame material will be either 3/4", fire-retardant, exterior-grade plywood or wood-particle board and 14-gauge cadmium-plated or chromized carbon steel. neoprene, closed-cell, expanded rubber, precoated with a rubber-based adhesive is present on each filter.

More information on HEPA filters can be obtained from RFETS Standard SMU-401 (EG&G 1991).

The IDC 490 HEPA filters in this backlog population consist of filters from Buildings 374, 771, 774, 776, and 777. The majority of these filters do not contain hazardous constituents, although evaporated solvents may have been contacted. HEPA filters from Plenums 104A and 104B in Building 374 have contacted hazardous constituents from the Saltcrete Process.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Magnesium oxide crucibles and crucible pieces from pyrochemistry operations. Crucibles may be crushed to pass through a ¼ inch sieve. Pyrochemical salts may exist in varying amounts. This waste stream does not include LECO crucibles or crucible inserts.

Waste Stream Source Description N/A

Current Container Comments N/A

EPA Comments N/A

Management Comments Waste Stream currently exists in the TWBIR as a residue, (i.e., RF-TRXXXX), but is being revised to transuranic, (i.e., RF-TTXXXX).

Acceptance Comments N/A

Final Form Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is construction rubble generated during decontamination and decommissioning activities. This waste consists of blacktop/concrete/dirt/sand. The waste is generated from construction/demolition within the plutonium process buildings. The waste is usually packed in 55-gal. drums with multiple bag liners, a fiberboard liner, and a rigid polyethylene liner. Also, the waste can be packaged in DOT 7A, Type A metal boxes which are lined with a fiberboard and PVC liner. This waste is identified by IDC 374. Inventory data include mixed residues in this IDC.

IDC 374-Construction rubble generated during decontamination and decommissioning operations.

Waste Stream Source Description Soil and cleanup-debris (IDC 374) were generated during cleanup and construction activities around Rocky Flats. In most cases, construction or demolition activities generated rubble consisting of blacktop, concrete, dirt, sand, and rock. The rubble was packaged in plywood boxes with a fiberboard liner and a polyvinyl chloride (PVC) bag liner or in 55-gallon, DOT Type 7A drums. The waste was generated on a nonroutine basis. Information describing spendid activities generating soil and debris were often unavailable.

Current Container Comments N/A

EPA Comments A-Process knowledge based upon general knowledge of waste type or source (e.g., there is some probability of a waste constituent being present or absent).

Bounding analytical data have not been compiled in a form that is compatible with this report. This effort is in progress and the results will be incorporated when the effort is complete.

No information available regarding uncertainty.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Processed filter media, IDC 376, is material which has been treated using Portland cement to absorb moisture and neutralize acid contamination. Filter waste is packaged in 55-gallon drums and metal standard waste boxes. Inventory data include residues within the same IDCs because they are regulated as waste.

Waste Stream Source Description The material in this IDC is the filter media portion of acid-contaminated glovebox or plenum HEPA filters or Ful-Flo filters with free liquids. Processing was performed in the Site Reduction Vaults in Building 776.

Used HEPA filters were processed to separate any portions containing high plutonium content from portions with low content. The wood frames were separated from the media and usually disposed of as waste by packing in a drum that was assigned IDC 330. The filter media pieces were identified as IDC 339 if they were high in radioactivity and packaged and stored for future recovery of the plutonium. If the pieces of media were low in radioactivity, they were identified as IDC 376 and packaged for shipment as waste. The media were placed in crates, Portland cement was added, then crates were sealed. Some IDC 376 material could be the remaining material after the IDC 338 media were processed to recover the plutonium.

Ful-Flo filters which were used to filter corrosive gas were also processed to separate any portions containing high plutonium content from portions with low plutonium content. Pieces of media with low activity were identified as IDC 376 and packaged for shipment as waste. The media were placed in approximately 10-gallon plastic bags and Portland cement was added. The bags were then sealed and placed in a drum.

IDC 376 filter media in this backlog population was derived from the processing of HEPA filters from Buildings 371, 771, 776, and 770. The HEPA filters could have originally been assigned ICDs 335 342, 490, 491 or 492. Filter media from Building 771 could have been used to filter nitric acid vapors.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	It consists of unleached resin (IDC 430).
Waste Stream Source Description	<p>Organic residues were generated at RFETS by process treatments in Buildings 371 and 771 and encompass IDCs 430 and 431. The purification processes generated unleached resin, IDC 430. There are about eight drums of this IDC in storage. The approximate dates of generation for this IDC began on October 24, 1986. The IDC 431, leached resin, was also generated by the cation exchange and anion exchange processes in Buildings 371 and 771. There are about one hundred and thirty containers of IDC 431 material in storage. The approximate dates of generation for this IDC began on July 31, 1987. Additional information specific to the ion-exchange resins were important to the plutonium purification processes at RFETS. Plutonium-contaminated materials were often dissolved in nitric acid and processed through ion exchange. The ion-exchange resin contained in an ion-exchange column was charged with highly concentrated nitric acids by trickling this solution through the columns. A plutonium-contaminated solution was then trickled through the column. The charged resin beads attracted the plutonium from the contaminated solution to the surface of the resin bead. The loaded resin beads were then leached by trickling another nitric acid solution through the tube. This final nitric solution drew the plutonium from the beads into solution and allowed for purification of the plutonium. The resin was periodically replaced when this process had depleted the efficiency of the resin. The ion exchange resins in use at Rocky Flats were generally small plastic (polystyrene) beads in which long-chain organic compounds with an activated group are imbedded (such as Dowex 1 x 2).</p> <p>Item Description Code 430--Resin, Unleached</p> <p>Unleached resin, IDC 430, was produced when the resin in ion exchange columns was replaced. Though this IDC is titled "unleached" resin, the generators of resins confirm that all resins were rinsed with, at least, weak acid before the resins were removed from the columns.</p> <p>Item Description Code 431--Resin, Leached</p> <p>Leached resin, IDC 431, was produced when the resin in ion exchange columns were replaced. The resin leached (rinsed) with water before the resin was removed from the columns.</p> <p>Item Description Code 809-Cemented Resins</p> <p>IDC 430 and 431 are cemented into waste forms IDC 809 due to being fine particulate nature. The solid waste form will be looked at to make sure it meets the WIPP WAC criteria.</p>

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description It consists of leached resin (IDC 431).

Waste Stream Source Description Organic residues were generated at RFETS by process treatments in Buildings 371 and 771 and encompass IDCs 430 and 431. The purification processes generated unleached resin, IDC 430. There are about eight drums of this IDC in storage. The approximate dates of generation for this IDC began on October 24, 1986. The IDC 431, leached resin, was also generated by the cation exchange and anion exchange processes in Buildings 371 and 771. There are about one hundred and thirty containers of IDC 431 material in storage. The approximate dates of generation for this IDC began on July 31, 1987. Additional information specific to the ion-exchange resins were important to the plutonium purification processes at RFETS. Plutonium-contaminated materials were often dissolved in nitric acid and processed through ion exchange. The ion-exchange resin contained in an ion-exchange column was charged with highly concentrated nitric acids by trickling this solution through the columns. A plutonium-contaminated solution was then trickled through the column. The charged resin beads attracted the plutonium from the contaminated solution to the surface of the resin bead. The loaded resin beads were then leached by trickling another nitric acid solution through the tube. This final nitric solution drew the plutonium from the beads into solution and allowed for purification of the plutonium. The resin was periodically replaced when this process had depleted the efficiency of the resin. The ion exchange resins in use at Rocky Flats were generally small plastic (polystyrene) beads in which long-chain organic compounds with an activated group are imbedded (such as Dowex 1 x 2).

Item Description Code 430--Resin, Unleached

Unleached resin, IDC 430, was produced when the resin in ion exchange columns was replaced. Though this IDC is titled "unleached" resin, the generators of resins confirm that all resins were rinsed with, at least, weak acid before the resins were removed from the columns.

Item Description Code 431--Resin, Leached

Leached resin, IDC 431, was produced when the resin in ion exchange columns were replaced. The resin leached (rinsed) with water before the resin was removed from the columns.

Item Description Code 809-Cemented Resins

IDC 430 and 431 are cemented into waste forms IDC 809 due to being fine particulate nature. The solid waste form will be looked at to make sure it meets the WIPP WAC criteria.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is contaminated insulation.

Waste Stream Source Description Item Description Code 334

During normal operations, fire blankets become soiled, contaminated, or are not longer needed in an area. There is one backlog drum of IDC 334. This drum was generated in Buidling 771 from July 1991 to December 1991.

Item Description Code 438

Maintenance, repair, and strip-out operations in Buildings 371, 374, 444, 559, 666, 707, 771, 774, 776, 777, 779, 865, 881, and 883 produced waste insulation. Insulation waste is generated by replacement of furnace heating elements, construction, maintenance, and demolition activities within the Protected Area at Rocky Flats. During these activities, insulation material is removed from furnaces, boilers, piping, ceilings and walls, and heating and cooling systems.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is made up of glass from analytical labs, recovery processes, ceramics, and glovebox windows.

Waste Stream Source Description IDC 440 includes glass waste from analytical laboratories and recovery processes, standard light bulbs generated inside the PA, and ceramic materials. Glass waste assigned IDC 440 was generated in Buildings 123, 371, 444, 559, 707, 771, 776, 777, 889.

IDC 441 includes unleached Raschig Rings to be discarded. Raschig Rings are borosilicate glass rings used to maintain subcritical conditions in fissile solution storage tanks that are not safe by dimension. The boron in the rings is a neutron poison, an element that absorbs neutrons. The volume of the ring displaces a proportionate volume of solution and, in combination with the boron, creates a critically safe configuration. Over time, the rings can become broken or otherwise damaged, especially in air-sparged tanks. In those cases, the rings were removed and replaced. The rings were also replaced if the assay of the tank exceeded acceptable limits. The old rings were assayed, and if the material count was above the economic discard limit (EDL), the rings were leached (rinsed with water or acid) and stored for plutonium recovery. If the material count was below EDL, the rings were packaged for discard without leaching. The unleached rings were assigned IDC 441.

Raschig Rings assigned IDC 441 were generated in Buildings 371 and 771. Rings generated in Building 371 were generated by the Process Vent Scrubber System in Rooms 1105 and 2319. The system removed nitric- and sulfuric-acid vapors and entrained liquids from the process vent header streams connected to the Building 371 tanks. The acids were neutralized with potassium hydroxide and water. Vent scrubbers D229 A and B were filled with Raschig Rings. Rings generated in Building 771 were generated in production processes in tanks used to temporarily store radioactive solutions. The solutions could have contained nitric or sulfuric acids, or potassium hydroxide.

Raschig Rings currently in WEMS assigned IDC 442 were generated in Buildings 771, 776, and 777. Prior to being replaced, the tanks were drained and the rings were leached with dilute nitric acid or water. The rings generated in Building 771 are from the production processes and Tanks D80-D85, D0-360, D-361, D-451-D-454, D-467, D-750, D-706, D-922, D-973, D-974, D-980, D-1008, D-1013, D-1022, and D-1081. Rings generated in Building 776 are from the Size Reduction Process and Tanks SR 3,4, and 5 and as unused rings.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Empty stainless steel transfer cans.

Waste Stream Source Description IDC 479 is assigned to empty reusable cans generated in Building 559, 707, and 771 (containers currently in WEMS from these buildings). Stainless-steel cans were used to handle plutonium-contaminated material. Primary generation was through the use of these cans to manually transfer materials between gloveboxes. Cans that were introduced to the process were typically recycled and reused. There were no generation process descriptions in WSRIC for this waste in Buildings 559, 707, and 771. In Building 371, the Dicesium Hexachloroplutonate (DCHP) Process often used the cans for transferring materials into the stacker.

IDC 480 is assigned to line- and nonline-generated light metals generated in Building 371, 374, 444, 559, 707, 774, 776, 777, 779, 865, and 991 (containers currently in WEMS from these buildings). Light metals include aluminum, copper, iron, brass, bronze, galvanized metal, stainless steel, carbon steel, and other metal alloys contained in waste mechanical and electrical parts, tools, containers, scrap metals, piping, wire, cable, gauges, valves, foil, planchets, and a variety of other metal items.

The maintenance operation was inextricably linked with the generation of the material that created this IDC. The maintenance operation was inextricably linked with the generation of the material that created this IDC. The maintenance-generated materials were generated throughout the entire facility. Backlog containers of this IDC may contain a matrix of all light metals listed above.

IDC 481 was assigned to light, nonspecial source metals. This material consisted primarily of stainless-steel and aluminum equipment used throughout the plant; this equipment was rinsed to remove plutonium contamination. This IDC is no longer active and has been replaced by IDC 480. The three containers in inventory were generated in Buildings 771, 776, and 777 in November 1984.

IDC 484 was assigned to classified non-nuclear material scrap metal shapes made primarily of stainless steel and aluminum. Prior to 1987, IDC 484 included beryllium shapes. These items were generated in Buildings 777 and 779 during disassembly operations of site-return units. Buildings 444, 707, and 883 generated rejected parts. Containers in inventory were generated from February 1983 to May 1991.

IDC 485 was assigned to scrap D-38 classified metal shapes. Generation of this material occurred in Building 777 during disassembly of site-return units. Building 444 generated rejected parts. Containers in inventory were generated from July 1987 to August 1992.

IDC 486 was assigned to classified tooling for disposal. Generation of these tools occurred in Buildings 707 and 777. The material consists primarily of obsolete tooling including pot chucks and inspection gauges. Containers in inventory were generated from October 1982 to December 1992.

IDC 489 was assigned to scrap D-38 classified metal shapes generated in Buildings 777 and 779 during disassembly of site-return units. containers in inventory were generated from February 1986 to September 1990.

IDC 824 is assigned to transuranic light metals generated in Buildings 371, 559, 707, and 771 (containers currently in WEMS from these buildings). Light metals include aluminum, copper, iron, brass, bronze, galvanized metal, stainless steel, carbon steel, and other metal alloys contained in waste mechanical and electrical parts, tools, containers, scrap metals, piping, wire, cable, gauges, valves, foil, planchets, and a variety of other metal items.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste includes items such as gloveboxes and machinery, and empty containers. Items that are difficult to reduce to a size that would fit in a 55-gal. drum are placed in DOT 7A, Type A metal boxes. These drums are lined with a rigid polyethylene liner, fiberboard liner and several bag liners. The boxes are lined with a fiberboard and PVC liner.

Waste Stream Source Description IDC 479 is assigned to empty reusable cans generated in Building 559, 707, and 771 (containers currently in WEMS from these buildings). Stainless-steel cans were used to handle plutonium-contaminated material. Primary generation was through the use of these cans to manually transfer materials between gloveboxes. Cans that were introduced to the process were typically recycled and reused. There were no generation process descriptions in WSRIC for this waste in Buildings 559, 707, and 771. In Building 371, the Dicesium Hexachloroplutonate (DCHP) Process often used the cans for transferring materials into the stacker.

IDC 480 is assigned to line- and nonline-generated light metals generated in Building 371, 374, 444, 559, 707, 774, 776, 777, 779, 865, and 991 (containers currently in WEMS from these buildings). Light metals include aluminum, copper, iron, brass, bronze, galvanized metal, stainless steel, carbon steel, and other metal alloys contained in waste mechanical and electrical parts, tools, containers, scrap metals, piping, wire, cable, gauges, valves, foil, planchets, and a variety of other metal items.

The maintenance operation was inextricably linked with the generation of the material that created this IDC. The maintenance operation was inextricably linked with the generation of the material that created this IDC. The maintenance-generated materials were generated throughout the entire facility. Backlog containers of this IDC may contain a matrix of all light metals listed above.

IDC 481 was assigned to light, nonspecial source metals. This material consisted primarily of stainless-steel and aluminum equipment used throughout the plant; this equipment was rinsed to remove plutonium contamination. This IDC is no longer active and has been replaced by IDC 480. The three containers in inventory were generated in Buildings 771, 776, and 777 in November 1984.

IDC 484 was assigned to classified non-nuclear material scrap metal shapes made primarily of stainless steel and aluminum. Prior to 1987, IDC 484 included beryllium shapes. These items were generated in Buildings 777 and 779 during disassembly operations of site-return units. Buildings 444, 707, and 883 generated rejected parts. Containers in inventory were generated from February 1983 to May 1991.

IDC 485 was assigned to scrap D-38 classified metal shapes. Generation of this material occurred in Building 777 during disassembly of site-return units. Building 444 generated rejected parts. Containers in inventory were generated from July 1987 to August 1992.

IDC 486 was assigned to classified tooling for disposal. Generation of these tools occurred in Buildings 707 and 777. The material consists primarily of obsolete tooling including pot chucks and inspection gauges. Containers in inventory were generated from October 1982 to December 1992.

IDC 489 was assigned to scrap D-38 classified metal shapes generated in Buildings 777 and 779 during disassembly of site-return units. containers in inventory were generated from February 1986 to September 1990.

IDC 824 is assigned to transuranic light metals generated in Buildings 371, 559, 707, and 771 (containers currently in WEMS from these buildings). Light metals include aluminum, copper, iron, brass, bronze, galvanized metal, stainless steel, carbon steel, and other metal alloys contained in waste mechanical and electrical parts, tools, containers, scrap metals, piping, wire, cable, gauges, valves, foil, planchets, and a variety of other metal items.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Classified non-nuclear material non-metal shapes.

Waste Stream Source Description IDC 479 is assigned to empty reusable cans generated in Building 559, 707, and 771 (containers currently in WEMS from these buildings). Stainless-steel cans were used to handle plutonium-contaminated material. Primary generation was through the use of these cans to manually transfer materials between gloveboxes. Cans that were introduced to the process were typically recycled and reused. There were no generation process descriptions in WSRIC for this waste in Buildings 559, 707, and 771. In Building 371, the Dicesium Hexachloroplutonate (DCHP) Process often used the cans for transferring materials into the stacker.

IDC 480 is assigned to line- and nonline-generated light metals generated in Building 371, 374, 444, 559, 707, 774, 776, 777, 779, 865, and 991 (containers currently in WEMS from these buildings). Light metals include aluminum, copper, iron, brass, bronze, galvanized metal, stainless steel, carbon steel, and other metal alloys contained in waste mechanical and electrical parts, tools, containers, scrap metals, piping, wire, cable, gauges, valves, foil, planchets, and a variety of other metal items.

The maintenance operation was inextricably linked with the generation of the material that created this IDC. The maintenance operation was inextricably linked with the generation of the material that created this IDC. The maintenance-generated materials were generated throughout the entire facility. Backlog containers of this IDC may contain a matrix of all light metals listed above.

IDC 481 was assigned to light, nonspecial source metals. This material consisted primarily of stainless-steel and aluminum equipment used throughout the plant; this equipment was rinsed to remove plutonium contamination. This IDC is no longer active and has been replaced by IDC 480. The three containers in inventory were generated in Buildings 771, 776, and 777 in November 1984.

IDC 484 was assigned to classified non-nuclear material scrap metal shapes made primarily of stainless steel and aluminum. Prior to 1987, IDC 484 included beryllium shapes. These items were generated in Buildings 777 and 779 during disassembly operations of site-return units. Buildings 444, 707, and 883 generated rejected parts. Containers in inventory were generated from February 1983 to May 1991.

IDC 485 was assigned to scrap D-38 classified metal shapes. Generation of this material occurred in Building 777 during disassembly of site-return units. Building 444 generated rejected parts. Containers in inventory were generated from July 1987 to August 1992.

IDC 486 was assigned to classified tooling for disposal. Generation of these tools occurred in Buildings 707 and 777. The material consists primarily of obsolete tooling including pot chucks and inspection gauges. Containers in inventory were generated from October 1982 to December 1992.

IDC 489 was assigned to scrap D-38 classified metal shapes generated in Buildings 777 and 779 during disassembly of site-return units. containers in inventory were generated from February 1986 to September 1990.

IDC 824 is assigned to transuranic light metals generated in Buildings 371, 559, 707, and 771 (containers currently in WEMS from these buildings). Light metals include aluminum, copper, iron, brass, bronze, galvanized metal, stainless steel, carbon steel, and other metal alloys contained in waste mechanical and electrical parts, tools, containers, scrap metals, piping, wire, cable, gauges, valves, foil, planchets, and a variety of other metal items.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Scrap D-38 classified metal shapes.

Waste Stream Source Description IDC 479 is assigned to empty reusable cans generated in Building 559, 707, and 771 (containers currently in WEMS from these buildings). Stainless-steel cans were used to handle plutonium-contaminated material. Primary generation was through the use of these cans to manually transfer materials between gloveboxes. Cans that were introduced to the process were typically recycled and reused. There were no generation process descriptions in WSRIC for this waste in Buildings 559, 707, and 771. In Building 371, the Dicesium Hexachloroplutonate (DCHP) Process often used the cans for transferring materials into the stacker.

IDC 480 is assigned to line- and nonline-generated light metals generated in Building 371, 374, 444, 559, 707, 774, 776, 777, 779, 865, and 991 (containers currently in WEMS from these buildings). Light metals include aluminum, copper, iron, brass, bronze, galvanized metal, stainless steel, carbon steel, and other metal alloys contained in waste mechanical and electrical parts, tools, containers, scrap metals, piping, wire, cable, gauges, valves, foil, planchets, and a variety of other metal items.

The maintenance operation was inextricably linked with the generation of the material that created this IDC. The maintenance operation was inextricably linked with the generation of the material that created this IDC. The maintenance-generated materials were generated throughout the entire facility. Backlog containers of this IDC may contain a matrix of all light metals listed above.

IDC 481 was assigned to light, nonspecial source metals. This material consisted primarily of stainless-steel and aluminum equipment used throughout the plant; this equipment was rinsed to remove plutonium contamination. This IDC is no longer active and has been replaced by IDC 480. The three containers in inventory were generated in Buildings 771, 776, and 777 in November 1984.

IDC 484 was assigned to classified non-nuclear material scrap metal shapes made primarily of stainless steel and aluminum. Prior to 1987, IDC 484 included beryllium shapes. These items were generated in Buildings 777 and 779 during disassembly operations of site-return units. Buildings 444, 707, and 883 generated rejected parts. Containers in inventory were generated from February 1983 to May 1991.

IDC 485 was assigned to scrap D-38 classified metal shapes. Generation of this material occurred in Building 777 during disassembly of site-return units. Building 444 generated rejected parts. Containers in inventory were generated from July 1987 to August 1992.

IDC 486 was assigned to classified tooling for disposal. Generation of these tools occurred in Buildings 707 and 777. The material consists primarily of obsolete tooling including pot chucks and inspection gauges. Containers in inventory were generated from October 1982 to December 1992.

IDC 489 was assigned to scrap D-38 classified metal shapes generated in Buildings 777 and 779 during disassembly of site-return units. containers in inventory were generated from February 1986 to September 1990.

IDC 824 is assigned to transuranic light metals generated in Buildings 371, 559, 707, and 771 (containers currently in WEMS from these buildings). Light metals include aluminum, copper, iron, brass, bronze, galvanized metal, stainless steel, carbon steel, and other metal alloys contained in waste mechanical and electrical parts, tools, containers, scrap metals, piping, wire, cable, gauges, valves, foil, planchets, and a variety of other metal items.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Classified plastic shapes.

Waste Stream Source Description IDC 302 includes Benelex and Plexiglas. Benelex is a very dense organic material used for radiation shielding around gloveboxes and tanks. In some cases, Benelex is laminated with lead. However, none of the containers identified here have lead lamination. The Benelex used by RFETS is usually 2 inches thick, although occasionally two 2-inch thick pieces were bolted together to increase shield thickness. Plexiglas is a trade name used to describe a family of polycarbonate materials used for radiation shielding in glovebox windows and equipment enclosures. Plexiglas glovebox windows are generally 2- to 4-inches thick and can be in various sizes and shapes.

Benelex and Plexiglas in the inventory were generated in Buildings 371, 707, 771, and 776. The IDC was generated as waste during replacement of shielding or stripout of unnecessary shielding during the installation of new gloveboxes or tanks.

IDC 330 is dry combustibles such as cloth, paper, and wood. This IDC changes to 821, 831, 851, or 861 at the point of assay, depending upon radiological content

IDC 336, wet combustibles, are materials such as, paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent an accumulation of free liquid. This IDC changes to 822, 832, 833, or 862 at the point of assay.

IDC 337 is PVC sheeting, poly bottles, supplied-air suits, polyethylene, and other plastics. This IDC changes to 825, 833, 853, or 863 at the point of assay.

IDC 487 is classified plastic shapes used in handling and shipping. If TRU, shapes must be declassified prior to shipment. If LLW, IDC must be authorized by NTS prior to shipment. Classified Waste drums must be stenciled and handled according to Safeguards and Security procedures.

IDC 821 is dry combustibles such as paper, cloth, and wood.

IDC 822 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

ICD 825 is PVC sheeting, poly bottles, supplied-air suits, and other plastic.

IDC 831 is dry combustibles such as paper, cloth, and wood.

IDC 832 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

IDC 833 is PVC sheeting, poly bottles, supplied-air suits, and other plastics.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Plenum HEPA filters.

Waste Stream Source Description Item Description Code 338-Filter Media

The material in this IDC is either the filter media portion of HEPA filters or surface-water filter. HEPA filters are used on gloveboxes and in large filter plenums. Sock filters were used to prefilter operable unit 2 (OU-2) surface water prior to activated carbon treatment.

IDC 338 filter media in this backlog population was derived from HEPA filters from Buildings 371, 374, 559, 707, 771, 776, and from surface-water filters used in OU-2. The HEPA filters could have originally been assigned IDCs 335, 342, 490, 491, or 492. Filter media from building 374 could have been generated from HEPA filters used in saltcrete processing; therefore, they could be contaminated with RCRA metals and F-listed solvents and sludges. Filter media from Building 771 could have been used to filter nitric acid vapors. Analytical data on the OU-2 surface waters indicates the sock filters are contaminated with F-Listed constituents carbon tetrachloride, trichloroethylene, and tetrachloroethylene. Chloroform, 1,1-dichloroethene, and vinyl chloride were also detected in the influent water analysis.

Item Description Code-331 Ful-Flo filters Not From Incinerator

These Ful-Flo filters are in-line cartridge filters used throughout Rocky Flats to remove particulates from fluid streams and typically filter down to 5, 1, and 0.5 micron-sized particulates. Ful-Flo filters are used in various liquid systems that include nitric- and chloride-acid systems, such as those found in plutonium recovery operations; caustic systems, such as those found in utilities scrubbing; solvent systems using carbon tetrachloride in machining operations; water systems, such as steam cleaning; and condensate collection. These filters are also used in lubricant oil filtration.

Ful-Flo filters are poly-fiber-wound cartridges, about 10" long by 3.5" in diameter. Other fiber filters, such as R-6 pads, may be included in this IDC. R-6 pads are cloth filters, about sixteen inches in diameter, used to filter solids from nitric acid solutions. Therefore, backlog material in this IDC cannot be considered homogeneous. Filter elements are produced by combining a media blanket and spirally wound matrix yarn on an inner core. The filter elements might have a polypropylene cap on one end. Both the media blanket and matrix yarn can be cotton or polypropylene. The inner core material can be constructed of polypropylene, tinned steel, or stainless steel. Warehouse data from Rocky Flats indicate that the inner-core material is polypropylene.

During normal process operations, IDC 331 Ful-Flo filters in this backlog population were used to filter particulates from liquid waste streams in Buildings 371, 707, 771, 776, 777, and 779. These waste streams were primarily from filtration of caustic solutions in Building 371, the carbon tetrachloride system and oil systems, and from filtration of water and developer in Building 707. In Building 771, the primary waste streams filtered were anion column feed, potassium hydroxide, nitrate feed, spent nitric acid and hydrofluoric acid from the scrubber, eluate and effluent exiting the ion-exchange columns, floor pick-up solution, steam condensate, and miscellaneous aqueous solutions. Hydraulic oil and floor pick-up solution were filtered in Building 776. In Buildings 777 and 779, Ful-Flo filters were used in the carbon tetrachloride system for purification of Freon TF and for filtration of incoming waters.

Typically, Ful-Flo filters were placed on drying racks pending bag-out of a glovebox. Filters were not always dried before removal from the glovebox. Filters were then "bagged out" of the glovebox and placed in a second layer of plastic. Next, the filters were placed in a "Poly Bottle" or "Clam Shell" (hard plastic container), then placed in a double-lined drum.

These Ful-Flo filters may be contaminated with acids, bases, carbon tetrachloride, chromium, Freon, and oil. They may contain relatively small amounts of free liquids.

Item Description Code 335-HEPA Glovebox Filters, Not Acid Contaminated

The material in this IDC is High Efficiency Particulate Air (HEPA) filters used in ventilation systems at Rocky Flats. HEPA filters have been and are used in all of the buildings which contain plutonium processing activities. HEPA filters are used on gloveboxes and in large filter plenums that filter the room air.

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-TT0490

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Used filters were removed from their position in the ventilation system and packaged for further processing. The filters used on gloveboxes (nominal 8" x 8" x 5") were identified as IDC 335 if they were not acid contaminated.

Item Description Code 342-HEPA Glovebox Filters, Acid Contaminated

HEPA filters are used on all gloveboxes to remove particulates from the atmosphere exiting the glovebox to the plenum exhaust system. The filters in IDC 342 are from gloveboxes with atmospheres that could cause the filters to be contaminated with acids or bases used in chemical processing.

Item Description Code 491-Plenum Prefilters

The material in this IDC is a variety of plenum prefilters used in the ventilation systems at Rocky Flats. Plenum prefilters have been and are used in all of the buildings that contain plutonium processing activities. These prefilters are used in large plenums that filter the room and glovebox air. Used prefilters were removed from their position in the ventilation system and packaged for further processing.

IDC 491 plenum prefilters range from furnace-type filters to pleated fiberglass filters and can be as large as 24" x 24" x 12". The filter medium consists of fiberglass packing or paper which may be more or less dense, depending on filtering needs. Wire mesh can be used to hold the media in place. The frame material for these prefilters is cardboard.

Item Description Code 490--HEPA Filters (24" x 24"), Not Acid Contaminated

The material in this IDC is HEPA filters used in the ventilation systems at the RFETS. HEPA filters are used in all of the buildings that contain plutonium processing activities. These HEPA filters are used in large filter plenums that filter the room and glovebox air.

Used filters were removed from their position in the ventilation system and packaged for further processing. The larger-sized filters used in filters plenums were identified and packaged as IDC 490 if not acid contaminated.

IDC 490 HEPA filters (24" x 24"), not acid contaminated, are large HEPA filters (nominal 24" x 24" x 5 or 24" x 12) that were used in filter plenum racks. These filters consist of filter media contained within a wooden or metal frame.

The filter medium is composed of glass fibers, with a small percentage percentage of asbestos. An organic binder, elastomeric adhesive, or polyurethane sealant was use during construction. The medium also contains corrugated aluminum foil. The newer HEPA media will consist of glass and aromatic polyamide fibers (Nomex) and aluminum alloy metal coated with a thermoset vinly or epoxy. Various sealants could be present. The material will not be homogenous because of the different materials used in the different sizes and by the different manufacturers of the filters. The material in IDC 490 has not been contaminated with acid.

The frame material will be either 3/4", fire-retareant, exterior-grade plywood or wood-particle board and 14-gauge cadmium-plated or chromized carbon steel. neoprene, closed-cell, expanded rubber, precoated with a rubber-based adhesive is present on each filter.

More information on HEPA filters can be obtained from RFETS Standard SMU-401 (EG&G 1991).

The IDC 490 HEPA filters in this backlog population consist of filters from Buildings 374, 771, 774, 776, and 777. The majority of these filtes do not contain hazardous consitutents, although evaporated solvents may have been contacted. HEPA filters from Plenums 104A and 104B in Building 374 have contacted hazardous constituents from the Saltcrete Process.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description As result of the shutdown of plutonium operations at RFP in November, 1989, several hundred plastic bottles and several tanks of process liquids remained in storage.

Waste Stream Source Description The miscellaneous liquids waste form includes uranium solutions from criticality laboratories (IDC 504).

Item Description Code 508

IDC 508 is hydrochloric acid (HCl) containing plutonium generated by various process operations and glovebox-cleaning operations using HCl. Process operations and glovebox-cleaning operations were defined based on preliminary analytical results.

IDC 508 was generated in Cation Exchange in Building 771 from washing residual impurities from the resin with dilute nitric acid.

Chemical Technology in Building 771 generated miscellaneous chloride acid solutions from Batch Chloride Dissolution. This process dissolved plutonium oxide with hydrochloric acid.

Dicesium hexachloroplutonate (DCHP) preparation in Building 371 also generated IDC 508. This process produced DCHP, a salt used to remove americium from nonspecification and impure plutonium oxide. The oxide was dissolved in hydrochloric acid and filtered. The filtrate was then precipitated using cesium chloride and sodium nitrite in hydrochloric acid and then filtered again. Plutonium was recovered from the DCHP precipitation filtrate through chloride anion exchange. This was achieved by processing the solution through ion columns, and the plutonium loaded onto the anion exchange resin while most of the impurities stayed in the solution. This solution then left the column as effluent (IDC 501). The ion column was later washed to release the chloride eluate (IDC 508).

Peroxide Precipitation in Building 779 reacted ion exchange effluent with hydrogen peroxide to produce plutonium peroxide, which was then calcined to produce plutonium oxide. The plutonium peroxide precipitate was filtered and washed.

Residue Recovery Extraction in Building 779 recovered actinides using aqueous leaching techniques. Hydrofluoric acid solutions containing aluminium fluoride, cesium chloride, calcium fluoride, and sodium nitrate were generated.

IDC 508 is mixed residue only.

Item Description Code 527

IDC 527 is caustic waste solutions consisting of sodium hydroxide or potassium hydroxide. Low-Level Dissolution in Building 771 used potassium hydroxide for flushing the condenser when dissolving incinerator ash. H-4 Support Vacuum Systems used potassium hydroxide in an aqueous solution as a seal liquid. Vacuum Systems also used a seal liquid made up of water only.

IDC 527 is mixed residue only.

Item Description Code 541

Building 371

The Building 371 analytical laboratory receives liquid and solid samples from the entire plant site. Samples that are destined for Building 881 are analyzed in Building 371 to screen out those with high levels of radioactivity. Sludge and aqueous samples from Building 374 are analyzed for total alpha activity and plutonium, uranium, and americium content. Prior to analysis, the sludges are dissolved in nitric acid, hydrogen fluoride, or hydrochloric acid. Reagents are also used in sample preparation. Unused portions or excess prepared sample are placed in 4-liter plastic bottles.

Title 40 CFR Part 191 Subparts B and C Compliance Recertification Application 2004

TWBIR ID: RF-TT0541

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Building 559

The Building 559 analytical laboratory also receives liquid and solid samples from the entire plant site. Samples are analyzed for various ions, iron, silicon, isotopic composition, and americium, gallium, neptunium, plutonium, uranium, and other metals (Resource Conservation and Recovery Act [RCRA]-regulated and nonregulated). Solid samples are dissolved in a variety of acids, including nitric and hydrochloric. Other chemicals used in the laboratory include methanol, chloroform, and other organic solvents; titanium trichloride; ceric ammonium nitrate; sodium hydroxide; silver chloride; silver nitrate; and various metals standards. Unused portions or excess prepared samples are placed in 4-liter plastic bottles. Metal standards are also placed in the bottles.

Building 771

The Building 771 analytical laboratory also receives liquid and solid samples from the entire plant site. Samples are analyzed for various metals and ions, pH, and radioactivity. The principal chemicals used in the lab include sodium hydroxide, hydrochloric acid, nitric acid, cyclohexane, trioctyl phosphine oxide, yttrium, and various metal standards. Unused portions or excess prepared samples are placed in 4-liter plastic bottles. Metal standards are also placed in the bottles.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description IDC 802 is a cemented final waste form.

Waste Stream Source Description IDC No. 802. This waste stream is liquid waste solidified with Portland Cement. This waste consists of waste liquids from the analytical labs, research and development laboratories, and maintenance shops which are packaged and sent to Building 774 for immobilization with Portland cement and absorbent cement. These are wastes which are incompatible with the process collection system and the liquid waste treatment plant. Acidic wastes are neutralized before immobilization. Immobilization is done in 55-gallon drums. Approximately 21 gallons of waste are added to each drum prior to storage. This waste stream is newly identified since the Storage and Inventory Report.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description It consists of unleached resin (IDC 430) and leached resin (IDC 431).

Waste Stream Source Description Organic residues were generated at RFETS by process treatments in Buildings 371 and 771 and encompass IDCs 430 and 431. The purification processes generated unleached resin, IDC 430. There are about eight drums of this IDC in storage. The approximate dates of generation for this IDC began on October 24, 1986. The IDC 431, leached resin, was also generated by the cation exchange and anion exchange processes in Buildings 371 and 771. There are about one hundred and thirty containers of IDC 431 material in storage. The approximate dates of generation for this IDC began on July 31, 1987. Additional information specific to the ion-exchange resins were important to the plutonium purification processes at RFETS. Plutonium-contaminated materials were often dissolved in nitric acid and processed through ion exchange. The ion-exchange resin contained in an ion-exchange column was charged with highly concentrated nitric acids by trickling this solution through the columns. A plutonium-contaminated solution was then trickled through the column. The charged resin beads attracted the plutonium from the contaminated solution to the surface of the resin bead. The loaded resin beads were then leached by trickling another nitric acid solution through the tube. This final nitric solution drew the plutonium from the beads into solution and allowed for purification of the plutonium. The resin was periodically replaced when this process had depleted the efficiency of the resin. The ion exchange resins in use at Rocky Flats were generally small plastic (polystyrene) beads in which long-chain organic compounds with an activated group are imbedded (such as Dowex 1 x 2).

Item Description Code 430--Resin, Unleached

Unleached resin, IDC 430, was produced when the resin in ion exchange columns was replaced. Though this IDC is titled "unleached" resin, the generators of resins confirm that all resins were rinsed with, at least, weak acid before the resins were removed from the columns.

Item Description Code 431--Resin, Leached

Leached resin, IDC 431, was produced when the resin in ion exchange columns were replaced. The resin leached (rinsed) with water before the resin was removed from the columns.

Item Description Code 809-Cemented Resins

IDC 430 and 431 are cemented into waste forms IDC 809 due to being fine particulate nature. The solid waste form will be looked at to make sure it meets the WIPP WAC criteria.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists mainly of cloth and paper products from cleanup of gloveboxes and spills.

Waste Stream Source Description IDC 302 includes Benelex and Plexiglas. Benelex is a very dense organic material used for radiation shielding around gloveboxes and tanks. In some cases, Benelex is laminated with lead. However, none of the containers identified here have lead lamination. The Benelex used by RFETS is usually 2 inches thick, although occasionally two 2-inch thick pieces were bolted together to increase shield thickness. Plexiglas is a trade name used to describe a family of polycarbonate materials used for radiation shielding in glovebox windows and equipment enclosures. Plexiglas glovebox windows are generally 2- to 4-inches thick and can be in various sizes and shapes.

Benelex and Plexiglas in the inventory were generated in Buildings 371, 707, 771, and 776. The IDC was generated as waste during replacement of shielding or stripout of unnecessary shielding during the installation of new gloveboxes or tanks.

IDC 330 is dry combustibles such as cloth, paper, and wood. This IDC changes to 821, 831, 851, or 861 at the point of assay, depending upon radiological content

IDC 336, wet combustibles, are materials such as, paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent an accumulation of free liquid. This IDC changes to 822, 832, 833, or 862 at the point of assay.

IDC 337 is PVC sheeting, poly bottles, supplied-air suits, polyethylene, and other plastics. This IDC changes to 825, 833, 853, or 863 at the point of assay.

IDC 487 is classified plastic shapes used in handling and shipping. If TRU, shapes must be declassified prior to shipment. If LLW, IDC must be authorized by NTS prior to shipment. Classified Waste drums must be stenciled and handled according to Safeguards and Security procedures.

IDC 821 is dry combustibles such as paper, cloth, and wood.

IDC 822 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

ICD 825 is PVC sheeting, poly bottles, supplied-air suits, and other plastic.

IDC 831 is dry combustibles such as paper, cloth, and wood.

IDC 832 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

IDC 833 is PVC sheeting, poly bottles, supplied-air suits, and other plastics.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists of cemented miscellaneous sludge (IDC 823)

Waste Stream Source Description IDC 823, cemented miscellaneous sludge, was generated when sludge designated as inorganic particulate and sludgy material that was below the economic discard limit (EDL) was placed in 1-gallon paint cans and covered with Portland cement or mixed with cement into a block. The first scenario was conducted in Building 771 and the second in Building 371. This could have included IDCs 290-299 and was done to meet the Waste Isolation Pilot Plant (WIPP) waste acceptance criteria. The material came primarily from Nash pumps in Building 771 and included vacuum grease and oily sludge. One drum of the material was apparently generated when the pit in front of Building 707 was cleaned out. However, the contents of the pit sludge could not be ascertained. One drum was generated in the Size Reduction Vault in Building 776. Six drums were generated in Bulding 774 and stored in Building 371.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste includes items such as gloveboxes and machinery, and empty containers. Items that are difficult to reduce to a size that would fit in a 55-gal. drum are placed in DOT 7A, Type A metal boxes. These drums are lined with a rigid polyethylene liner, fiberboard liner and several bag liners. The boxes are lined with a fiberboard and PVC liner.

Waste Stream Source Description IDC 479 is assigned to empty reusable cans generated in Building 559, 707, and 771 (containers currently in WEMS from these buildings). Stainless-steel cans were used to handle plutonium-contaminated material. Primary generation was through the use of these cans to manually transfer materials between gloveboxes. Cans that were introduced to the process were typically recycled and reused. There were no generation process descriptions in WSRIC for this waste in Buildings 559, 707, and 771. In Building 371, the Dicesium Hexachloroplutonate (DCHP) Process often used the cans for transferring materials into the stacker.

IDC 480 is assigned to line- and nonline-generated light metals generated in Building 371, 374, 444, 559, 707, 774, 776, 777, 779, 865, and 991 (containers currently in WEMS from these buildings). Light metals include aluminum, copper, iron, brass, bronze, galvanized metal, stainless steel, carbon steel, and other metal alloys contained in waste mechanical and electrical parts, tools, containers, scrap metals, piping, wire, cable, gauges, valves, foil, planchets, and a variety of other metal items.

The maintenance operation was inextricably linked with the generation of the material that created this IDC. The maintenance operation was inextricably linked with the generation of the material that created this IDC. The maintenance-generated materials were generated throughout the entire facility. Backlog containers of this IDC may contain a matrix of all light metals listed above.

IDC 481 was assigned to light, nonspecial source metals. This material consisted primarily of stainless-steel and aluminum equipment used throughout the plant; this equipment was rinsed to remove plutonium contamination. This IDC is no longer active and has been replaced by IDC 480. The three containers in inventory were generated in Buildings 771, 776, and 777 in November 1984.

IDC 484 was assigned to classified non-nuclear material scrap metal shapes made primarily of stainless steel and aluminum. Prior to 1987, IDC 484 included beryllium shapes. These items were generated in Buildings 777 and 779 during disassembly operations of site-return units. Buildings 444, 707, and 883 generated rejected parts. Containers in inventory were generated from February 1983 to May 1991.

IDC 485 was assigned to scrap D-38 classified metal shapes. Generation of this material occurred in Building 777 during disassembly of site-return units. Building 444 generated rejected parts. Containers in inventory were generated from July 1987 to August 1992.

IDC 486 was assigned to classified tooling for disposal. Generation of these tools occurred in Buildings 707 and 777. The material consists primarily of obsolete tooling including pot chucks and inspection gauges. Containers in inventory were generated from October 1982 to December 1992.

IDC 489 was assigned to scrap D-38 classified metal shapes generated in Buildings 777 and 779 during disassembly of site-return units. containers in inventory were generated from February 1986 to September 1990.

IDC 824 is assigned to transuranic light metals generated in Buildings 371, 559, 707, and 771 (containers currently in WEMS from these buildings). Light metals include aluminum, copper, iron, brass, bronze, galvanized metal, stainless steel, carbon steel, and other metal alloys contained in waste mechanical and electrical parts, tools, containers, scrap metals, piping, wire, cable, gauges, valves, foil, planchets, and a variety of other metal items.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists mainly of cloth and paper products from cleanup of gloveboxes and spills.

Waste Stream Source Description IDC 302 includes Benelex and Plexiglas. Benelex is a very dense organic material used for radiation shielding around gloveboxes and tanks. In some cases, Benelex is laminated with lead. However, none of the containers identified here have lead lamination. The Benelex used by RFETS is usually 2 inches thick, although occasionally two 2-inch thick pieces were bolted together to increase shield thickness. Plexiglas is a trade name used to describe a family of polycarbonate materials used for radiation shielding in glovebox windows and equipment enclosures. Plexiglas glovebox windows are generally 2- to 4-inches thick and can be in various sizes and shapes.

Benelex and Plexiglas in the inventory were generated in Buildings 371, 707, 771, and 776. The IDC was generated as waste during replacement of shielding or stripout of unnecessary shielding during the installation of new gloveboxes or tanks.

IDC 330 is dry combustibles such as cloth, paper, and wood. This IDC changes to 821, 831, 851, or 861 at the point of assay, depending upon radiological content

IDC 336, wet combustibles, are materials such as, paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent an accumulation of free liquid. This IDC changes to 822, 832, 833, or 862 at the point of assay.

IDC 337 is PVC sheeting, poly bottles, supplied-air suits, polyethylene, and other plastics. This IDC changes to 825, 833, 853, or 863 at the point of assay.

IDC 487 is classified plastic shapes used in handling and shipping. If TRU, shapes must be declassified prior to shipment. If LLW, IDC must be authorized by NTS prior to shipment. Classified Waste drums must be stenciled and handled according to Safeguards and Security procedures.

IDC 821 is dry combustibles such as paper, cloth, and wood.

IDC 822 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

ICD 825 is PVC sheeting, poly bottles, supplied-air suits, and other plastic.

IDC 831 is dry combustibles such as paper, cloth, and wood.

IDC 832 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

IDC 833 is PVC sheeting, poly bottles, supplied-air suits, and other plastics.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists mainly of cloth and paper products from cleanup of gloveboxes and spills.

Waste Stream Source Description IDC 302 includes Benelex and Plexiglas. Benelex is a very dense organic material used for radiation shielding around gloveboxes and tanks. In some cases, Benelex is laminated with lead. However, none of the containers identified here have lead lamination. The Benelex used by RFETS is usually 2 inches thick, although occasionally two 2-inch thick pieces were bolted together to increase shield thickness. Plexiglas is a trade name used to describe a family of polycarbonate materials used for radiation shielding in glovebox windows and equipment enclosures. Plexiglas glovebox windows are generally 2- to 4-inches thick and can be in various sizes and shapes.

Benelex and Plexiglas in the inventory were generated in Buildings 371, 707, 771, and 776. The IDC was generated as waste during replacement of shielding or stripout of unnecessary shielding during the installation of new gloveboxes or tanks.

IDC 330 is dry combustibles such as cloth, paper, and wood. This IDC changes to 821, 831, 851, or 861 at the point of assay, depending upon radiological content

IDC 336, wet combustibles, are materials such as, paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent an accumulation of free liquid. This IDC changes to 822, 832, 833, or 862 at the point of assay.

IDC 337 is PVC sheeting, poly bottles, supplied-air suits, polyethylene, and other plastics. This IDC changes to 825, 833, 853, or 863 at the point of assay.

IDC 487 is classified plastic shapes used in handling and shipping. If TRU, shapes must be declassified prior to shipment. If LLW, IDC must be authorized by NTS prior to shipment. Classified Waste drums must be stenciled and handled according to Safeguards and Security procedures.

IDC 821 is dry combustibles such as paper, cloth, and wood.

IDC 822 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

ICD 825 is PVC sheeting, poly bottles, supplied-air suits, and other plastic.

IDC 831 is dry combustibles such as paper, cloth, and wood.

IDC 832 is wet combustibles such as paper, cloth, and wood, which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent accumulation of free liquid.

IDC 833 is PVC sheeting, poly bottles, supplied-air suits, and other plastics.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description "Repackaged spent salt from the MSE scrub alloy process including materials from failed production runs. Salts which become IDC 429R for disposal include MSE, unknown percent unpulverized (IDC 405), MSE, unknown percent pulverized (IDC 406), MSE, 8 percent unpulverized (IDC 407), MSE, 8 percent pulverized (IDC 408), MSE, 30 percent unpulverized (IDC 409), MSE, 30 percent pulverized (IDC 410), plutonium chloride mixed salt (IDC 415), MSE salt packaged for LANL (IDC 418), stabilized scrub alloy spent salt (IDC 429X), and scrub alloy spent salt (IDC 429). This output may also contain some broken or irregularly shaped pieces of magnesium oxide ceramic crucible coated with pyrochemical salt."

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms.
Waste Stream Source Description	This waste stream consists of contact-handled TRU waste from the Fuel Reprocessing Plant using the Plutonium/Uranium Solvent Extraction Process.
Current Container Comments	N/A
EPA Comments	N/A
Management Comments	Inventory is from the site's record solid waste tracking system, a requirement of DOE Order 5820.A, Radioactive Waste Management. Of the TRU waste stored from May 1970 to December 1986 that has not been assayed and redesignated as low level waste (by December 1993), 50% of the waste stored in 55-gallon drums, and 85% of the waste stored in boxes are expected to be TRU waste upon assaying. The remainder is expected to be low-level waste upon assaying. The reported volumes and radionuclides have been adjusted to take this assumption into account. Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Waste in boxes will be opened, and size-reduced to fit into TRUPACT-II SWBs. No volume reduction is projected. Upper and lower weights of final waste form are unknown.
Acceptance Comments	N/A
Final Form Comments	Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Upper and lower weights of final waste form are unknown.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	Waste consists of soil contaminated with TRU solutions. Soil is contained in a 0.3 mm polyethylene bag within an inner container. The outer container is a standard 55-gallon drum. Vermiculite is a packing material between the inner and outer container.
Waste Stream Source Description	This waste stream consists of TRU waste from the retrieved contaminated soil from the 216-Z-9 Trench. Soil is contaminated by TRU liquid waste.
Current Container Comments	N/A
EPA Comments	N/A
Management Comments	Inventory is from the site's record solid waste tracking system, a requirement of DOE Order 5820.A, Radioactive Waste Management. Of the TRU waste stored from May 1970 to December 1986 that has not been assayed and redesignated as low level waste (by December 1993), 50% of the waste stored in 55-gallon drums is expected to be TRU waste upon assaying. The remainder is expected to be low-level waste upon assaying. The reported volumes and radionuclides have been adjusted to take this assumption into account. Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Upper and lower weights of final waste form are unknown.
Acceptance Comments	N/A
Final Form Comments	Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Upper and lower weights of final waste form are unknown.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms.

Waste Stream Source Description This waste stream consists of TRU waste from the Chemical Separation Areas Operations Laboratory.

Current Container Comments N/A

EPA Comments N/A

Management Comments Inventory is from the site's record solid waste tracking system, a requirement of DOE Order 5820.A, Radioactive Waste Management. Of the TRU waste stored from May 1970 to December 1986 that has not been assayed and redesignated as low level waste (by December 1993), 50% of the waste stored in 55-gallon drums, and 85% of the waste stored in boxes are expected to be TRU waste upon assaying. The remainder is expected to be low-level waste upon assaying. The reported volumes and radionuclides have been adjusted to take this assumption into account. Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified waste in drums (WHC-SD-W026-SDRD-001, Rev. 3). Waste in boxes will be opened, and size-reduced to fit into TRUPACT-II SWBs. No volume reduction is projected. Upper and lower weights of final waste form are unknown.

Acceptance Comments N/A

Final Form Comments Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. TRU WASTE BASELINE INVENTORY WASTE PROFILE

Final Form Radionuclides
(Continued)

Isotope	Typical Concentration (Ci/m3)
Y-90	5.62E-03

Waste Stream Description Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms.

Waste Stream Source Description This waste stream consists of TRU waste from the Plutonium Finishing Plant.

Current Container Comments N/A

EPA Comments N/A

Management Comments Inventory is from the site's record solid waste tracking system, a requirement of DOE Order 5820.A, Radioactive Waste Management. Of the TRU waste stored from May 1970 to December 1986 that has not been assayed and redesignated as low level waste (by December 1993), 50% of the waste stored in 55-gallon drums, and 85% of the waste stored in boxes are expected to be TRU waste upon assaying. The remainder is expected to be low-level waste upon assaying. The reported volumes and radionuclides have been adjusted to take this assumption into account. Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Waste in boxes will be opened, and size-reduced to fit into TRUPACT-II SWBs. No volume reduction is projected. Upper and lower weights for final waste form are unknown.

Acceptance Comments The contact-handled TRU waste from Building 2345Z was reported in Waste Nos. RL-T146 and RL-T150 in Revision 1 of the WTWBIR. This waste is reported in RL-T107 in Revision 2; RL-T146 and RL-T150 have been deleted in Revision 2.

Final Form Comments Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Upper and lower weights for final waste form are unknown.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixtures, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms.
Waste Stream Source Description	This waste stream consists of TRU waste from the 200 Area Waste Tank Farms and other miscellaneous sources in the Chemical Separations Area.
Current Container Comments	N/A
EPA Comments	N/A
Management Comments	Inventory is from the site's record solid waste tracking system, a requirement of DOE Order 5820.A, Radioactive Waste Management. Of the TRU waste stored from May 1970 to December 1986 that has not been assayed and redesignated as low level waste (by December 1993), 50% of the waste stored in 55-gallon drums, and 85% of the waste stored in boxes are expected to be TRU waste upon assaying. The remainder is expected to be low-level waste upon assaying. The reported volumes and radionuclides have been adjusted to take this assumption into account. Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Waste in boxes will be opened, and size-reduced to fit into TRUPACT-II SWBs. No volume reduction is projected. Upper and lower weights of final waste form are unknown.
Acceptance Comments	N/A
Final Form Comments	Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Upper and lower weights for final waste form are unknown.

The remainder is expected to be low-level waste upon assaying. The reported volumes and radionuclides have been adjusted to take this assumption into account. Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Waste in boxes will be opened, and size-reduced to fit into TRUPACT-II SWBs. No volume reduction is projected. Upper and lower weights for final waste form are unknown.
Acceptance Comments	N/A
Final Form Comments	Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Upper and lower weights for final waste form are unknown.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms.

Waste Stream Source Description This waste stream consists of TRU waste from the Critical Mass Laboratory.

Current Container Comments N/A

EPA Comments N/A

Management Comments Inventory is from the site's record solid waste tracking system, a requirement of DOE Order 5820.A, Radioactive Waste Management. Of the TRU waste stored from May 1970 to December 1986 that has not been assayed and redesignated as low level waste (by December 1993), 50% of the waste stored in 55-gallon drums, and 85% of the waste stored in boxes are expected to be TRU waste upon assaying. The remainder is expected to be low-level waste upon assaying. The reported volumes and radionuclides have been adjusted to take this assumption into account. Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Waste in boxes will be opened, and size-reduced to fit into TRUPACT-II SWBs. No volume reduction is projected. Upper and lower weights for final waste form are unknown.

Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms.

Waste Stream Source Description This waste stream consists of contact-handled TRU waste from the Radiological Calibrations Laboratory, Chemical Engineering Building, Radiochemistry Building laboratory and hot cells, and cesium recovery facility of the Radiochemistry Building, and Radioanalytical Laboratory.

Current Container Comments N/A

EPA Comments N/A

Management Comments Inventory is from the site's record solid waste tracking system, a requirement of DOE Order 5820.A, Radioactive Waste Management. Of the TRU waste stored from May 1970 to December 1986 that has not been assayed and redesignated as low level waste (by December 1993), 50% of the waste stored in 55-gallon drums, and 85% of the waste stored in boxes are expected to be TRU waste upon assaying. The remainder is expected to be low-level waste upon assaying. The reported volumes and radionuclides have been adjusted to take this assumption into account. Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Waste in boxes will be opened, and size-reduced to fit into TRUPACT-II SWBs. No volume reduction is projected. Upper and lower weights for final waste form are unknown.

Acceptance Comments The contact-handled TRU waste from Building 318 was reported as Waste No. RL-T117 in Revision 1 of the WTWBIR. This waste is reported in RL-T118 in Revision 2; RL-T117 has been deleted.

Final Form Comments Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Upper and lower weights for final waste form are unknown.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms.

Waste Stream Source Description This waste stream consists of TRU waste from the construction activities.

Current Container Comments N/A

EPA Comments N/A

Management Comments Inventory is from the site's record solid waste tracking system, a requirement of DOE Order 5820.A, Radioactive Waste Management. Of the TRU waste stored from May 1970 to December 1986 that has not been assayed and redesignated as low level waste (by December 1993), 50% of the waste stored in 55-gallon drums, and 85% of the waste stored in boxes are expected to be TRU waste upon assaying. The remainder is expected to be low-level waste upon assaying. The reported volumes and radionuclides have been adjusted to take this assumption into account. Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Waste in boxes will be opened, and size-reduced to fit into TRUPACT-II SWBs. No volume reduction is projected. Upper and lower weights for final waste form are unknown.

Acceptance Comments N/A

Final Form Comments Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Upper and lower weights for final waste form are unknown.

EPA Comments	N/A
Management Comments	Inventory is from the site's record solid waste tracking system, a requirement of DOE Order 5820.A, Radioactive Waste Management. Of the TRU waste stored from May 1970 to December 1986 that has not been assayed and redesignated as low level waste (by December 1993), 50% of the waste stored in 55-gallon drums is expected to be TRU waste upon assaying. The remainder is expected to be low-level waste upon assaying. The reported volumes and radionuclides have been adjusted to take this assumption into account. Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Upper and lower weights for final waste form are unknown.
Acceptance Comments	N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms.

Waste Stream Source Description This waste stream consists of contact-handled TRU waste from the Babcock Wilcox.

Current Container Comments N/A

EPA Comments N/A

Management Comments Inventory is from the site's record solid waste tracking system, a requirement of DOE Order 5820.A, Radioactive Waste Management. Of the TRU waste stored from May 1970 to December 1986 that has not been assayed and redesignated as low level waste (by December 1993), 50% of the waste stored in 55-gallon drums, and 85% of the waste stored in boxes are expected to be TRU waste upon assaying. The remainder is expected to be low-level waste upon assaying. The reported volumes and radionuclides have been adjusted to take this assumption into account. Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Waste in boxes will be opened, and size-reduced to fit into TRUPACT-II SWBs. No volume reduction is projected. Upper and lower weights for final waste form are unknown.

Acceptance Comments N/A

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Absorbed combustible liquids such as oils have also been placed in some drums. Drums are also used for disposal of high-efficiency particulate air filters.

Waste Stream Source Description This waste stream consists of contact-handled TRU waste from the Energy Systems Group.

Current Container Comments N/A

EPA Comments N/A

Management Comments Inventory is from the site's record solid waste tracking system, a requirement of DOE Order 5820.A, Radioactive Waste Management. Of the TRU waste stored from May 1970 to December 1986 that has not been assayed and redesignated as low level waste (by December 1993), 50% of the waste stored in 55-gallon drums is expected to be TRU waste upon assaying. The remainder is expected to be low-level waste upon assaying. The reported volumes and radionuclides have been adjusted to take this assumption into account. Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Upper and lower weights for final waste form are unknown.

Acceptance Comments N/A

Final Form Comments Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Upper and lower weights for final waste form are unknown.

Waste Stream Description Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Absorbed combustible liquids such as oils have also been placed in some drums. Drums are also used for disposal of high-efficiency particulate air filters.

Waste Stream Source Description This waste stream consists of contact-handled TRU waste from Kerr McGee.

Current Container Comments N/A

EPA Comments N/A

Management Comments Inventory is from the site's record solid waste tracking system, a requirement of DOE Order 5820.A, Radioactive Waste Management. Of the TRU waste stored from May 1970 to December 1986 that has not been assayed and redesignated as low level waste (by December 1993), 50% of the waste stored in 55-gallon drums is expected to be TRU waste upon assaying. The remainder is expected to be low-level waste upon assaying. The reported volumes and radionuclides have been adjusted to take this assumption into account. Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Upper and lower weights for final waste form are unknown.

Acceptance Comments N/A

Final Form Comments Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Upper and lower weights for final waste form are unknown.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms.

Waste Stream Source Description This waste consists of typically contact-handled TRU waste from the General Electric Plants at San Jose and Vallecitos.

Current Container Comments N/A

EPA Comments N/A

Management Comments Inventory is from the site's record solid waste tracking system, a requirement of DOE Order 5820.A, Radioactive Waste Management. Of the TRU waste stored from May 1970 to December 1986 that has not been assayed and redesignated as low level waste (by December 1993), 50% of the waste stored in 55-gallon drums, and 85% of the waste stored in boxes are expected to be TRU waste upon assaying. The remainder is expected to be low-level waste upon assaying. The reported volumes and radionuclides have been adjusted to take this assumption into account. Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Waste in boxes will be opened, and size-reduced to fit into TRUPACT-II SWBs. No volume reduction is projected. Upper and lower weights for final waste form are unknown.

Acceptance Comments The Type I and II GE Pleasanton waste reported in Waste Nos. RL-T138 and RL-T139 and RL-139, and the GE Vallecitos waste reported in RL-T144 in Revision 1 of the TWBIR have been merged in Revision 2 with the waste reported in RL-T143. RL-T138, RL-T139, and RL-T144 have been deleted in Revision 2.

Final Form Comments Waste in drums will be opened, examined to remove non-certifiable waste, and then packaged into new drums. The projection is that repackaging will result in a 35% increase in the volume of TRU-certified wastes in drums (WHC-SD-W026-SDRD-001, Rev. 3). Upper and lower weights for final waste form are unknown.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Final Form Radionuclides
(Continued)

Isotope	Typical Concentration (Ci/m3)
Y-90	1.54E+03

Waste Stream Description Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms.

Waste Stream Source Description This waste stream consists of typically remote-handled TRU waste from the Chemical Engineering Building and Post Irradiation Test Laboratory.

Current Container Comments N/A

EPA Comments N/A

Management Comments Inventory is from the site's record solid waste tracking system, a requirement of DOE Order 5820.2A, Radioactive Waste Management. Upper and lower weights of final waste form are unknown.

Acceptance Comments The remote-handled TRU waste from Building 324 reported under Waste No. RL-T147 in Revision 1 of the TWBIR has been merged with waste reported under RL-T148. This waste is reported in RL-T148 in Revision 2.

Final Form Comments Upper and lower weights of final waste form are unknown.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Typically, 70 to 80% of the waste in the drums is combustible items such as wood, plastics, paper, absorbents, rubber and rags. Approximately 20 to 30% of the waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing fixtures and soil. Boxes typically contain whole and sectioned glove boxes, hoods, conduit, lathes, pumps, fans, light fixtures, tools conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oil have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms.

Waste Stream Source Description The waste stream is from facility clean-out and D&D waste from the T-Plant Canyon and Decontamination facility.

Current Container Comments N/A

EPA Comments Data are compiled from waste manifest data on each container of TRU waste.

Management Comments The assumption is that the WIPP No Migration Petition will be approved by EPA and the State of New Mexico. Under the assumption, treatment of the waste stream to meet LDR is not required nor planned.

Acceptance Comments N/A

Final Form Comments N/A

Waste Stream Description The waste stream typically contains equipment including but not limited to saws, manipulators, hoists, hoods, lathes, and cabinetry.

Waste Stream Source Description The waste stream is large tanks/dissolvers/pumps/concentrator. Size reduction is required to package the waste into RH canisters.

Current Container Comments Size reduction is assumed for large items. Volume is assumed to remain the same as a result of size reduction.

EPA Comments N/A

Management Comments N/A

Acceptance Comments The research and development roles expected to be assumed by 327 before closure have not been defined.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste stream is surplus facility clean-out and D&D waste which range from contaminated clothing, to process equipment.

Waste Stream Source Description Facility clean-out and D&D from the 100-N Reactor Facility.

Current Container Comments Size reduction is assumed for large items. Volume is assumed to remain the same as a result of size reduction.

Waste Stream Description The waste stream is large tanks/dissolvers/pumps/concentrator. Size reduction is required to package the waste into RH canisters.

Waste Stream Source Description Cleanout of contaminated equipment/removable piping etc. from PUREX facility.

Current Container Comments Size reduction is assumed for large items. Volume is assumed to remain the same as a result of size reduction.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream consists of soil contaminated with liquid solutions, previously buried solid waste, and associated contaminated soil, and sludges from previously used tanks or tank-like units.

Waste Stream Source Description The waste is from retrieval of contaminated soils. The waste may also include solid waste from past practice burial grounds and solidified sludge from miscellaneous past practice tanks.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste stream is surplus facilities cleanout and D&D wastes, ranging from contaminated clothing to process equipment and sludges.

Waste Stream Source Description Cleanout and D&D of all 100 Area Inactive Facilities (including C, D, DR, KE, KW, H, F, and N reactors, 104F and H Storage Basins, 100N Deactivation, N Basin Cleanout, Emergency Dump Basin, and the Spacer Silo) and the following 200 Area Inactive Facilities: 202S (REDOX), 233S (Plutonium Concentration Facility), and 221S (U Plant).

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the PUREX CANYON AND SERVICE FACILITY.
Waste Stream Source Description	The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the PUREX CANYON AND SERVICE FACILITY.
Current Container Comments	N/A
EPA Comments	N/A
Management Comments	N/A
Acceptance Comments	N/A
Final Form Comments	For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the PLUTONIUM FABRICATION FACILITY.

Waste Stream Source Description The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the PLUTONIUM FABRICATION FACILITY.

Current Container Comments N/A

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the PLUTONIUM FABRICATION FACILITY.
Waste Stream Source Description	The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the PLUTONIUM FABRICATION FACILITY.
Current Container Comments	N/A
EPA Comments	N/A
Management Comments	N/A
Acceptance Comments	N/A
Final Form Comments	For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the PLUTONIUM FABRICATION FACILITY.
Waste Stream Source Description	The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the PLUTONIUM FABRICATION FACILITY.
Current Container Comments	N/A
EPA Comments	N/A
Management Comments	N/A
Acceptance Comments	N/A
Final Form Comments	For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the WAREHOUSE.

Waste Stream Source Description The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the WAREHOUSE.

Current Container Comments N/A

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the FUELS DEVELOPMENT LABORATORY.

Waste Stream Source Description The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the FUELS DEVELOPMENT LABORATORY.

Current Container Comments N/A

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

TWBIR ID: RL-W601

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste is generated from R&D/R&D Laboratory Waste activities at the CHEMICAL ENGINEERING BUILDING.

Waste Stream Source Description The waste is generated from R&D/R&D Laboratory Waste activities at the CHEMICAL ENGINEERING BUILDING.

Current Container Comments N/A

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

TWBIR ID: RL-W608

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste is generated from R&D/R&D Laboratory Waste activities at the CHEMICAL ENGINEERING BUILDING.

Waste Stream Source Description The waste is generated from R&D/R&D Laboratory Waste activities at the CHEMICAL ENGINEERING BUILDING.

Current Container Comments N/A

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste is generated from R&D/R&D Laboratory Waste activities at the CHEMICAL ENGINEERING BUILDING.

Waste Stream Source Description The waste is generated from R&D/R&D Laboratory Waste activities at the CHEMICAL ENGINEERING BUILDING.

Current Container Comments N/A

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste is generated from R&D/R&D Laboratory Waste activities at the RADIOCHEMISTRY BUILDING.

Waste Stream Source Description The waste is generated from R&D/R&D Laboratory Waste activities at the RADIOCHEMISTRY BUILDING.

Current Container Comments N/A

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	The waste is generated from R&D/R&D Laboratory Waste activities at the RADIOCHEMISTRY BUILDING.
Waste Stream Source Description	The waste is generated from R&D/R&D Laboratory Waste activities at the RADIOCHEMISTRY BUILDING.
Current Container Comments	N/A
EPA Comments	N/A
Management Comments	N/A
Acceptance Comments	N/A
Final Form Comments	For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	The waste is generated from R&D/R&D Laboratory Waste activities at the RADIOCHEMISTRY BUILDING.
Waste Stream Source Description	The waste is generated from R&D/R&D Laboratory Waste activities at the RADIOCHEMISTRY BUILDING.
Current Container Comments	N/A
EPA Comments	N/A
Management Comments	N/A
Acceptance Comments	N/A
Final Form Comments	For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

TWBIR ID: RL-W646

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste is generated from R&D/R&D Laboratory Waste activities at the RADIOCHEMISTRY BUILDING.

Waste Stream Source Description The waste is generated from R&D/R&D Laboratory Waste activities at the RADIOCHEMISTRY BUILDING.

Current Container Comments N/A

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the POST IRRADIATION TEST LABORATORY.

Waste Stream Source Description The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the POST IRRADIATION TEST LABORATORY.

Current Container Comments N/A

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste is generated from Materials Production/Recovery Effluents activities at the POST IRRADIATION TEST LABORATORY C CELL.

Waste Stream Source Description The waste is generated from Materials Production/Recovery Effluents activities at the POST IRRADIATION TEST LABORATORY C CELL.

Current Container Comments N/A

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the REPACKAGED WASTE.

Waste Stream Source Description The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the REPACKAGED WASTE.

Current Container Comments N/A

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the TANK FARMS.

Waste Stream Source Description The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the TANK FARMS.

Current Container Comments N/A

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments For convenience projected waste generation has been inserted into streams which have the largest existing volume relative to the generator source

Waste Stream Description Solidified aqueous waste slurry.

Waste Stream Source Description N/A

Current Container Comments N/A

EPA Comments The EPA codes are the same as reported for the same waste stream in the Interim Mixed Waste Inventory Report (IMWIR), April 1993. These EPA codes are based on the identification and characteristics of the generating waste stream. The D002 code, however, is assigned because the waste while in interim storage must be adjusted to a high pH to prevent corrosion of the containment structure. As indicated in the source description, the interim storage tank contains an additional IMWIR waste stream, DST MISCELLANEOUS WASTE. Physically, the PFP TRU solids have settled to the bottom of the tank and are a distinct layer from the liquids, DST MISCELLANEOUS WASTE. Nevertheless, the EPA codes for the PFP TRU solids waste stream may be modified in the future to include the EPA codes associated with DST MISCELLANEOUS WASTE to account for potential mixing of this stream with the PFP TRU solids. The additional EPA codes reported in the IMWIR for this stream are D004, D005, D006, D009, D010, D011, F003, F005.

Management Comments Waste will be packaged with an absorbent for neutralization

Acceptance Comments Each 55 gallon (0.21 m3) drum contains 40 to 45 (0.151 to 0.170 m3) of waste plus 10 to 15 gal (0.038 to 0.057 m3) of absorbent.

Final Form Comments Waste is currently RH; however, it may be, if cost effective, processed resulting in CH final waste form. Total volume of stream is 371 m3 in final waste form and 270 m3 in interim waste form. The difference in the volume between the final and interim for is the addition of absorbent. Projected waste is planned, but the amount has yet to be determined.

Waste Stream Description Solidified aqueous waste slurry

Waste Stream Source Description N/A

Current Container Comments N/A

EPA Comments The EPA codes are the same as reported for the same waste stream in the Interim Mixed Waste Inventory The EPA codes are the same as reported for the same waste stream in the Interim Mixed Waste Inventory Report, April 1993. These EPA codes are based on the identification and characteristics of the generating waste stream. The D002 code, however, is assigned because the waste while in interim storage must be adjusted to a high pH to prevent corrosion of the containment structure. An additional IMWIR waste stream, DST MISCELLANEOUS WASTE is stored in the tank, which represents the liquid layer in the tank. However, as stated under waste stream source description, the origin of the waste in these tanks is from the separation of cladding waste from PUREX. As such, the EPA codes for this layer are the same as the EPA codes for the PUREX TRU Cladding Removal Solids

Management Comments Waste will be packaged with an absorbent for neutralization.

Acceptance Comments Each 55 gallon (0.21 m3) drum contains 40 to 45 (0.151 to 0.170 m3) of waste plus 10 to 15 gal (0.038 to 0.057 m3) of absorbent.

Final Form Comments Waste is currently RH; however, it may be, if cost effective, processed resulting in CH final waste form. Total volume of stream is 2791 m3 in final waste form and 2030 m3 in interim waste form. The difference in the volume between the final and interim for is the addition of absorbent.

Waste Stream Description Solidified aqueous waste slurry.

Waste Stream Source Description N/A

Current Container Comments N/A

EPA Comments The EPA codes are based on the identification and characteristics of the generating waste stream. The D002 code, however, is assigned because the waste while in interim storage must be adjusted to a high pH to prevent corrosion of the containment structure. Additional waste stream characterization is planned that may result in revision to the EPA codes.

Management Comments Waste will be packaged with an absorbent for neutralization.

Acceptance Comments Each 55 gallon (0.21 m3) drum contains 40 to 45 (0.151 to 0.170 m3) of waste plus 10 to 15 gal (0.038 to 0.057 m3) of absorbent.

Final Form Comments Total volume of stream is 1484 m3 in final waste form and 1079 m3 in interim waste form. The difference in the volume between the final and interim form is the addition of absorbent. This stream has the potential to receive an additional 396,000 gallons (1397 m3) of as stored waste. On packaging the waste, the volume would increase to 500,000 gallons (1893 m3) of waste.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description Waste is in final form.

Waste Stream Source Description Heterogeneous mixture of metals and combustible lab trash including solidified waste, stainless steel, brass and aluminum parts, paper, plastics, rubber gloves, PPE, hepa filters and glass. There are no liquids or compressed gasses. All drums were verified through Real Time Radiography, (RTR).

Current Container Comments N/A

EPA Comments The entire waste stream was viewed through Real Time Radiography and videotapes and photographs of the waste are on file. In addition, the process knowledge from Lovelace ITRI indicates that contaminants are not present.

Management Comments This waste stream has been characterized by process knowledge as TRU waste. The waste is not mixed.

Acceptance Comments N/A

Final Form Comments N/A

Waste Stream Description Heterogeneous Debris from SNL/NM Hot Cell Facility D&D project and other miscellaneous waste generators.

Waste Stream Source Description This waste stream was generated during SNL Hot Cell Facility experiments that including the cutting of fuel rods. There are no liquids or compressed gasses in this waste stream.

Current Container Comments Assumption: site submittal identified 1 m3 projected in the 98-02 time frame. This 1 m3 was assumed to be stored in 03. Tbrown

EPA Comments N/A

Management Comments N/A

Acceptance Comments N/A

Final Form Comments 8 drums of tru waste are estimated to be generated with the FY1996 hot cell decontamination project. This is a one time generation.

Annex J

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is defense related, contact handled TRU waste and is composed of Job Control waste, sludges and resins, HEPA filters and large, metal equipment

Waste Stream Source Description This stream was produced in various onsite Plutonium production facilities as well as analytical and R&D laboratories.

Current Container Comments Radionuclide concentrations may vary from 3.2.6.

EPA Comments N/A

Management Comments The current plan is to characterize the waste followed by shipment and disposal at WIPP. HEPA filters packaged in polyboxes will be packaged into SWB's. All miscellaneous box waste and waste currently stored in 12'x18x7' steel boxes will be shipped utilizing 5'x5'x8' or smaller containers that meet TRUPACT III and WIPP disposal limits. Regulatory relief is expected to allow shipment of the higher activity drummed waste without volume expansion. Only physical dimension limitations have been assumed for TRUPACT III. For drums that assay at < 100nCi/g, overpacking with > 100nCi/g, drums into TDOPs is planned; however, TDOPs are not identified in the final waste form container description.

Acceptance Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is defense related, contact handled TRU waste and is composed of Job Control waste, sludges and resins, HEPA filters and large, metal equipment

Waste Stream Source Description This stream was produced in various onsite Plutonium production facilities as well as analytical and R&D laboratories.

Current Container Comments Radionuclide concentrations may vary from 3.2.6.

EPA Comments N/A

Management Comments The current plan is to characterize the waste followed by shipment and disposal at WIPP. HEPA filters packaged in polyboxes will be packaged into SWB's. All miscellaneous box waste and waste currently stored in 12'x18x7' steel boxes will be shipped utilizing 5'x5'x8' or smaller containers that meet TRUPACT III and WIPP disposal limits. Regulatory relief is expected to allow shipment of the higher activity drummed waste without volume expansion. Only physical dimension limitations have been assumed for TRUPACT III. For drums that assay at < 100nCi/g, overpacking with > 100nCi/g, drums into TDOPs is planned; however, TDOPs are not identified in the final waste form container description.

Acceptance Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste consists of miscellaneous job control waste such as laboratory supplies used in research programs in the shielded cells, e.g. glassware, paper wipes, stainless steel samples vials, poly bottles, pipettes and small lab equipment (stirrers, heaters). In addition to the job control waste, this stream contains shavings from the cuttings of a Mark 16 fuel element. Presently, this waste stream is stored as RH, but is reported as CH because after processing this stream will be CH.

Waste Stream Source Description This stream was generated as a result of experiments and activities at SRTC in the 773-A Shielded Cells Facility (E-wing). Work was performed with samples of low activity waste from tanks 42 and 51, high activity waste from 11 and 15, salt from tank 41 and 13, process waste from tank 17, in addition to other isotopes stored in the cells,

Current Container Comments This box is placed in a cask for storage.

EPA Comments N/A

Management Comments This waste will be repackaged for shipment to WIPP.

Acceptance Comments N/A

Annex J

TWBIR ID: W006-773A-VIT

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description The stream is a xylene-based chelating agent. It is a homogeneous, flammable liquid containing hazardous constituents. Total activity is 100 nCi/g. The waste is contact handled. TTA stands for Thenoyl Trifluoroacetone.

Waste Stream Source Description This stream is generated from plutonium extraction analytical procedures at the Savannah River Technology Center. It consists of a homogenous, xylene based, liquid chelating agent.

Current Container Comments "SAF-T-CAN" Brand, 1 gallon capacity

EPA Comments This waste is ignitable only - no contaminant concentration values are used, other than xylenes > 99%. This waste will need treatment before it is acceptable at WIPP.

Management Comments The waste is stored in a stainless steel can, (Safe-T-Can brand for storage of flammable liquids), in a Satellite Accumulation Area (SAA), which is located in a laboratory hood in Lab B-138 of Building 773-A of SRTC.

The preferred option in the PSTP is to assay and characterize the waste stream at the TRU Waste Certification/Characterization Facility (TWCCF), followed by preparation for shipment and disposal at WIPP. Because of the small volume of the stream alternative treatment options are being investigated. One alternative is to handle the waste as a 90 day generator, remove the TRU portion of the stream, and treat the ignitable characteristic.

Acceptance Comments GENOPERATI: Chemical Analysis and experimentation - laboratory conducts experiments on low- and high-level radioactive materials, in addition to non-radioactive testing. RECLASS_CO: NA. CATION: HNO₃ = 10E-3 (Molar Based on solubility after contact with 1Molar HNO₃) per lab procedure.

Final Form Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description 200 Areas (F and H Separations Facilities). This waste is primarily solids consisting of mainly booties, lab coats, floor sweepings, rags, labware, and other job control wastes. Small Hepas, liquids, sludges and resins may also be found in this stream. The waste is generated primarily through separation activities in the course of plutonium production, includes small amounts of TRU waste from on site laboratories.

Waste Stream Source Description This waste is generated primarily through separations activities for Plutonium production. A small fraction comes from research activities.

Current Container Comments None

EPA Comments N/A

Management Comments The current plan is to characterize the waste follower by shipment and disposal at WIPP. HEPA filters packaged in polyboxes will be packaged into Standard Waste Boxes. All miscellaneous box waste and waste currently stored in 12'x18'x7' steel boxes will be shipped utilizing 5'x5'x8' or smaller containers that meet TRUPACT III and WIPP disposal limits. Regulatory relief is expected to allow shipment of the higher activity drummed waste without volume expansion. Only physical dimension limitations have been assumed for TRUPACT III. For drums that assay at <100nCi/g, overpacking with >100nCi/g drums into TDOPs is planned; however, TDOPs are not identified in the final waste form container description.

Acceptance Comments Waste is double-bagged and placed in a 90-mil polyethylene drum liner inside a 55-gallon carbon steel drum. The liner lid is glued in place. Drums with greater than 0.5 Ci total activity are placed inside concrete culverts for additional shielding. In addition, large carbon steel boxes are used to store waste equipment from the Canyon processes and other large, bulky wastes.

Final Form Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description 200 Areas (F and H Separations Facilities). This waste is primarily solids consisting of mainly booties, lab coats, floor sweepings, rags, labware, and other job control wastes. Small Hepas, liquids, sludges and resins may also be found in this stream. The waste is generated primarily through separation activities in the course of plutonium production, includes small amounts of TRU waste from on site laboratories.

Waste Stream Source Description This waste is generated primarily through separations activities for Plutonium production. A small fraction comes from research activities.

Current Container Comments N/A

EPA Comments N/A

Management Comments The current plan is to characterize the waste followed by shipment and disposal at WIPP. HEPA filters packaged in polyboxes will be packaged into SWB's. All miscellaneous box waste and waste currently stored in 12'x18x7' steel boxes will be shipped utilizing 5'x5'x8' or smaller containers that meet TRUPACT III and WIPP disposal limits. Regulatory relief is expected to allow shipment of the higher activity drummed waste without volume expansion. Only physical dimension limitations have been assumed for TRUPACT III. For drums that assay at < 100nCi/g, overpacking with > 100nCi/g, drums into TDOPs is planned; however, TDOPs are not identified in the final waste form container description.

Acceptance Comments Waste is double-bagged and placed in a 90-mil polyethylene drum liner inside a 55-gallon carbon steel drum. The liner lid is glued in place. Drums with greater than 0.5 Ci total activity are placed inside concrete culverts for additional shielding. In addition, large carbon steel boxes are used to store waste equipment from the Canyon processes and other large, bulky wastes.

Final Form Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description	This waste stream is primarily solids consisting of booties, lab coats, floor sweeping, labware, rags, and other job control waste. This stream differs from SR-W026 because solvent rags are suspected to be in the waste.
Waste Stream Source Description	This waste is generated primarily through separations activities for Plutonium production. A small fraction comes from research activities.
Current Container Comments	Radionuclide concentration may vary from 3.2.6.
EPA Comments	A conservative interpretation of the mixed waste rule resulted in this waste stream being listed as solvent waste because of the potential presence of solvent rags.
Management Comments	The current plan is to characterize the waste followed by shipment and disposal at WIPP. HEPA filters packaged in polyboxes will be packaged into SWB's. All miscellaneous box waste and waste currently stored in 12'x18x7' steel boxes will be shipped utilizing 5'x5'x8' or smaller containers that meet TRUPACT III and WIPP disposal limits. Regulatory relief is expected to allow shipment of the higher activity drummed waste without volume expansion. Only physical dimension limitations have been assumed for TRUPACT III. For drums that assay at < 100nCi/g, overpacking with > 100nCi/g, drums into TDOPs is planned; however, TDOPs are not identified in the final waste form container description.
Acceptance Comments	Section 7.1: Breakdown of container #'s is estimated from total # in storage. Boxes and drums in culverts on Pads 7-17 are assumed to be TRU. For other pads and containers, 64% are estimated to be TRU. Waste on Pads 1-6 is assumed to be all solvent rags. Section 7.2: SRS TRU waste is found under TRUCON codes SR116A,B,C, SR122A,B,C and SR125A. GENERAAREA: 221 HB-Line, 221 FB-Line, 773-A, 772-F, 235-FGENOPERATI: Production of plutonium, uranium, neptunium, and laboratory support activities. RECLASS_CO: All waste identified by SR-W025, W026, W027, W033 will be assayed to determine TRU classification. Current classifications are based on process knowledge. CATION: NALDR_DETERM: Wastes placed in storage prior to LDR effective date (11/8/86). WASTE_PACK: Waste is double-bagged and placed in a 90-mil polyethylene drum liner inside a 55-gallon carbon steel drum. The liner lid is glued in place. Drums with greater than 0.5 Ci total activity are placed inside concrete culverts for additional shielding. In addition, large carbon steel boxes are used to store waste equipment from the Canyon processes and other large, bulky wastes.

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream is primarily solids consisting of booties, lab coats, floor sweeping, labware, rags, and other job control waste. This stream differs from SR-W026 because solvent rags are suspected to be in the waste.

Waste Stream Source Description This waste is generated primarily through separations activities for Plutonium production. A small fraction comes from research activities.

Current Container Comments Radionuclide concentration may vary from 3.2.6.

EPA Comments A conservative interpretation of the mixed waste rule resulted in this waste stream being listed as solvent waste because of the potential presence of solvent rags.

Management Comments The current plan is to characterize the waste followed by shipment and disposal at WIPP. HEPA filters packaged in polyboxes will be packaged into SWB's. All miscellaneous box waste and waste currently stored in 12'x18x7' steel boxes will be shipped utilizing 5'x5'x8' or smaller containers that meet TRUPACT III and WIPP disposal limits. Regulatory relief is expected to allow shipment of the higher activity drummed waste without volume expansion. Only physical dimension limitations have been assumed for TRUPACT III. For drums that assay at < 100nCi/g, overpacking with > 100nCi/g, drums into TDOPs is planned; however, TDOPs are not identified in the final waste form container description.

Acceptance Comments Section 7.2: SRS TRU waste is found under TRUCON codes SR116A,B,C, SR122A,B,C and SR125A. GENERAAREA: 221 HB-Line, 221 FB-Line, 773-A, 772-F, 235-FGENOPERATI: Production of plutonium, uranium, neptunium, and laboratory support activities. RECLASS_CO: All waste identified by SR-W025, W026, W027, W033 will be assayed to determine TRU classification. Current classifications are based on process knowledge. CATION: NALDR_DETERM: Wastes placed in storage prior to LDR effective date (11/8/86). WASTE_PACK: Waste is double-bagged and placed in a 90-mil polyethylene drum liner inside a 55-gallon carbon steel drum. The liner lid is glued in place. Drums with greater than 0.5 Ci total activity are placed inside concrete culverts for additional shielding. In addition, large carbon steel boxes are used to store waste equipment from the Canyon processes and other large, bulky wastes.

Final Form Comments N/A

TRU WASTE BASELINE INVENTORY WASTE PROFILE

Waste Stream Description This waste stream consists of Rocky Flats Incinerator Ash and F-listed solvents, and is contaminated with TRU nuclides from SRS laboratories. This waste is classified as contact-handled.

Waste Stream Source Description This ash was sent to SRS from Rocky Flats for research into plutonium recovery. The ash was classified as hazardous by the Colorado Court System based on chemical analysis of F-listed solvent waste processed in the Rocky Flats Incinerator. SRS subsequently cancelled the research. The ash was declared mixed after SRS handled the waste as a Special Nuclear Material (SNM) in a SRTC vault.

Current Container Comments paper cartons are placed in 30 gallon shipping containers

EPA Comments The confidence level is low because process knowledge was used for characterization, no analytical data is available.

Management Comments The preferred treatment option is to return the ash to Rocky Flats for consolidation and treatment with similar wastes. Treatment (if any) would then be at the discretion of Rocky Flats. Until a full agreement between SRS and RF has been reached, preliminary plans indicate SRS would add this small stream to a larger stream for vitrification.

The waste itself is in four small cartons which are placed in 30 gallon shipping containers at a ratio of two small cartons per shipping container.

Acceptance Comments One-time generation. Went in storage prior to the effective date of May 8, 1992.

Final Form Comments This stream is currently stored in a total of 4 cartons which are placed in 30 gallon shipping containers (not TRAMPAC approved). 2 cartons per shipping container. The containers are stored in 235-F.
