3 **RENEWAL APPLICATION**
4 **ADDENDUM B1**

5 **TOTALS ANALYSIS VERSUS TOXICITY**
6 **CHARACTERISITIC LEACHING PROCEDURE**
7

8 Data from totals analyses (total organic compound analysis and total metals analysis) are
9 compared to the Regulatory Levels (**RL**) expressed as total values. Regulatory Level values are
10 obtained by calculating the weight/weight concentration (in the solid) of a Toxicity
11 Characteristic (**TC**) analyte that would give the regulatory weight/volume concentration (in the
12 extract), assuming 100 percent analyte dissolution. Table B1-1 lists the TC levels expressed as
13 RL values for toxicity characteristic leaching procedure (**TCLP**) and total analysis.
14

15 To demonstrate the appropriateness and conservatism of using totals analysis rather than the
16 TCLP, consider the following example. Assume that a solid sample contains 100 milligrams per
17 kilogram (mg/kg) of lead (Pb). The current TCLP regulatory level for Pb is five milligrams per
18 liter (mg/L). This is comparable to a concentration of five mg/kg as demonstrated by the
19 following calculation:
20

21
$$\frac{5 \text{ mg Pb}}{1 \text{ L solution}} \times \frac{1 \text{ L solution}}{1000 \text{ milliliters (mL) solution}} \times \frac{1 \text{ mL solution}}{1 \text{ gram (g) solution}} \times \frac{1000 \text{ g solution}}{1 \text{ kg solution}} = 5 \text{ mg Pb/kg}$$

22
23 When one compares the predicted results of totals analysis and TCLP analysis on the same
24 sample, the following is observed:
25

26 Totals Analysis
27

28 Analyzing a sample by totals analysis yields a result equal to the actual contaminant
29 concentration in the sample (assuming that the instrument and the methodology are 100 percent
30 accurate).
31

32 Predicted result = 100 mg Pb/kg sample
33

34 TCLP Analysis
35

36 Assuming that five grams (g) of sample is extracted and analyzed, 100 g of extraction fluid must
37 be used (TCLP requires that the weight of extraction fluid must be 20 times the weight of the
38 solid sample). Assuming that 100 percent of the lead in the sample is leachable, and as a result,
39 is extracted into the solution where it will be detected in the analysis, the predicted concentration
40 of the TCLP solution will be five mg/kg, as demonstrated in the following calculation:

1
2

3

$$\frac{5 \text{ g sample} \times \frac{100 \text{ mg Pb}}{1 \text{ kg sample}} \times \frac{1 \text{ kg sample}}{1000 \text{ g sample}}}{100 \text{ g solution} \times \frac{1 \text{ kg solution}}{1000 \text{ g solution}}} = 5 \text{ mg Pb/kg solution}$$

4

5 These calculations demonstrate that, by conservatively assuming a 100 percent leaching
6 efficiency, a concentration of 100 mg/kg obtained by totals analysis is comparable to a
7 concentration of five mg/kg (or five mg/L) using TCLP (See Figure B1-1). As such, by using a
8 regulatory level of 100 mg/kg for totals analysis for lead (i.e., 20 times the TCLP level), the U.S.
9 Department of Energy is taking a conservative approach to the regulation, because a leaching
10 efficiency of 100 percent is improbable. A comparison of the regulatory levels used for TCLP
11 versus totals analysis for all TC analytes is present in Table B1-1.

12

13 This approach was also addressed by the U.S. Environmental Protection Agency (**EPA**) in the
14 preamble to a proposed rule issued in the Federal Register (FR) on October 24, 1991. In this
15 preamble, the EPA stated the following:

16

17 One could compare the numerical value of a potential TCLP standard to a theoretical
18 maximum leaching level derived from a total constituent standard. One would have to
19 assume that the entire amount of the toxicity characteristic constituent (as represented by
20 the total constituent concentration at the level of the standard) would be extracted into an
21 aqueous leaching medium. One would then have to account for the 20-fold dilution
22 inherent in the TCLP analytical procedure. A theoretical maximum leaching value could,
23 thus be calculated by dividing the numerical value of the total constituent treatment
24 standard by a factor of 20 (56 FR 55167).

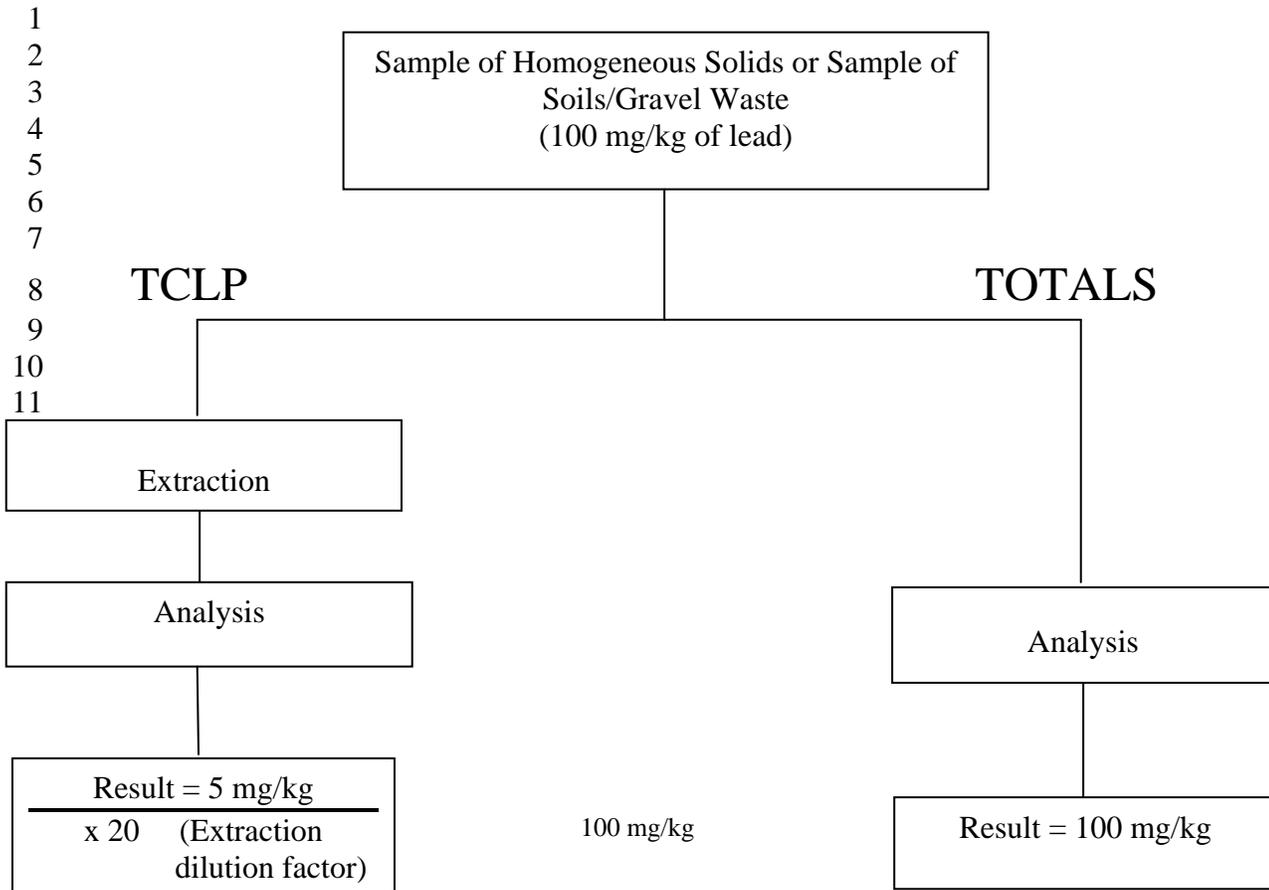

TABLE B1-1
RLs FOR TCLP ANALYSIS VS. RLs FOR TOTALS ANALYSIS

Analyte	TCLP RL Value (mg/kg)	Totals RL Value (mg/kg) ^a
<u>Metals and Semi-VOCs^b</u>		
Arsenic	5.0	100
Barium	100.0	2000
Cadmium	1.0	20
Chromium	5.0	100
Cresols	200.0	4000
1,4-Dichlorobenzene	7.5	150
2,4-Dinitrotoluene	0.13	2.6
Hexachlorobenzene	0.13	2.6
Hexachloroethane	3.0	60
Lead	5.0	100
Mercury	0.2	4
Nitrobenzene	2.0	40
Pentachlorophenol	100.0	2000
Pyridine	5.0	100
Selenium	1.0	20
Silver	5.0	100
<u>VOCs^c</u>		
Benzene	0.5	10
Carbon tetrachloride	0.5	10
Chlorobenzene	100.0	2000
Chloroform	6.0	120
1,2-Dichloroethane	0.5	10
1,1-Dichloroethylene	0.7	14
Methyl ethyl ketone	200.0	4000
Pyridine	5.0	100
Tetrachloroethylene	0.7	14
Trichloroethylene	0.5	10
Vinyl Chloride	0.2	4

^aThe calculations assume 1) the maximum amount of material suggested by the TCLP is used, 2) wastes are 100 percent solid (no liquid fraction), 3) the maximum amount of extraction fluid is used, and 4) all analytes are 100 percent soluble in the extraction fluid.

^bFor metals and semi-VOCs, RL value (mg/kg) = (TC level, mg/L) (volume of extraction fluid, 2L)/(weight of sample, 0.100 kg)

^cFor VOCs, RL value (mg/kg) = (TC level, mg/l) (volume of extraction fluid, 0.5 L)/(weight of sample, 0.025 kg)
