23

1
2 IV.D.3. Ongoing Disposal Room VOC Monitoring in Panel 3 Through 7

3
4 The Permittees shall continue VOC monitoring in Room 1 of Panels 3 through 7
5 after completion of waste emplacement until final panel closure unless the
6 explosion isolation wall is installed in any of these panels.
7

8
9 IV.F.1 Geomechanical Monitoring

10
11
12 IV.F.4.b Reporting requirements - the Permittees shall submit to the
13 Secretary an annual report, beginning twelve (12) months after
14 issuance of this Permit, evaluating the geomechanical monitoring
15 program and shall include geomechanical data collected from
16 each Underground HWDU during the previous year, as specified
17 in Permit Attachment M2, Section M2-5b(2), "Geomechanical
18 Monitoring", and shall also include a map showing the current
19 status of HWDU mining. Also submitted at that time will be an
20 annual certification by a registered professional engineer
21 certifying the stability of any explosion isolation walls. The
22 Permittees will also notify the e-mail notification list within seven
23 (7) calendar days of submittal of this certification.
24

25 IV.F.5 Hydrogen and Methane Monitoring Program

26
27 IV.F.5.a Implementation of the Hydrogen and Methane Monitoring -
28 the Permittees shall implement the Hydrogen and Methane
29 Monitoring Program specified in Permit Attachment N1.

30
31 IV.F.5.b Notification Requirements -
32 The Permittees shall notify the Secretary in writing, within seven
33 (7) calendar days of obtaining validated analytical results,
34 whenever the concentration of hydrogen or methane in a filled
35 panel exceeds the Action Levels specified in Table IV.F.5.a below.
36
37 The Permittees will also notify the e-mail notification list within
38 seven (7) calendar days of obtaining validated analytical results if
39 the Action Levels are exceeded.

<u>Hydrogen</u>	<u>4000 ppm</u>	<u>8000 ppm</u>
<u>Methane</u>	<u>5000 ppm</u>	<u>10000 ppm</u>

IV.F.5.c Remedial Action - upon receiving validated analytical results that indicate that Action Level 1 has been reached or exceeded sampling will be increased to weekly. Upon receiving validated analytical results that indicate that Action Level 2 has been reached or exceeded in two consecutive weekly samples the explosion isolation wall will be installed.

IV.F.5.d Sampling Line Loss
Any loss of sampling lines will be evaluated as described in Section N1-5b, and notifications submitted to the Secretary and to the e-mail notification list within seven (7) calendar days of the discovery of loss of sampling line(s).

TABLE D-1 INSPECTION SCHEDULE/PROCEDURES			
System/Equipment Name	Responsible Organization	Inspection ^a Frequency and Job Title of Personnel Normally Making Inspection	Procedure Number and Inspection Criteria
Air Intake Shaft Hoist	Underground Operations	Preoperational ^c See Lists 1b and c	WP 04-HO1004 Inspecting for Deterioration ^b , Safety Equipment, Communication Systems, and Mechanical Operability ^m in accordance with Mine Safety and Health Administration (MSHA) requirements
Ambulances (Surface and Underground) and related emergency supplies and equipment	Emergency Services	Weekly See List 11	PM000030 Inspecting for Mechanical Operability ^m , Deterioration ^b , and Required Equipment ⁿ
Adjustable Center of Gravity Lift Fixture	Waste Handling	Preoperational See List 8	WP 05-WH1410 Inspecting for Mechanical Operability ^m and Deterioration ^b
Backup Power Supply Diesel Generators	Facility Operations	Monthly See List 3	WP 04-ED1301 Inspecting for Mechanical Operability ^m and Leaks/Spills by starting and operating both generators. Results of this inspection are logged in accordance with WP 04-AD3008.
Facility Inspections (Water Diversion Berms)	Facility Engineering	Annually See List 4	WP 10-WC3008 Inspecting for Damage, Impediments to water flow, and Deterioration ^b
Central Monitoring Systems (CMS)	Facility Operations	Continuous See List 3	Automatic Self-Checking
Contact-Handled (CH) TRU Underground Transporter	Waste Handling	Preoperational See List 8	WP 05-WH1603 Inspecting for Mechanical Operability ^m , Deterioration ^b , and area around transporter clear of obstacles
Facility Transfer Vehicle	Waste Handling	Preoperational See List 8	WP 05-WH1406 Inspecting for Mechanical Operability ^m , Deterioration ^b , path clear of obstacles, and guards in the proper place
Exhaust Shaft	Underground Operations	Quarterly See List 1a	PM041099 Inspecting for Deterioration ^b and Leaks/Spills
Eye Wash and Shower Equipment	Equipment Custodian	Weekly See List 5	WP 12-IS1832 Inspecting for Deterioration ^b
		Semi-annually See List 2a	WP 12-IS1832 Inspecting for Deterioration ^b and Fluid Levels—Replace as Required

**TABLE D-1
INSPECTION SCHEDULE/PROCEDURES**

System/Equipment Name	Responsible Organization	Inspection ^a Frequency and Job Title of Personnel Normally Making Inspection	Procedure Number and Inspection Criteria
Fire Detection and Alarm System	Emergency Services	Semiannually See List 11	PM000027 Inspecting for Deterioration ^b , Operability of indicator lights and, underground fuel station dry chemical suppression system. Inspection is per NFPA 72
Fire Extinguishers ^l	Emergency Services	Monthly See List 11	PM000036 Inspecting for Deterioration ^b , Leaks/Spills, Expiration, seals, fullness, and pressure
Fire Hoses	Emergency Services	Annually (minimum) See List 11	PM000031 Inspecting for Deterioration ^b and Leaks/Spills
Fire Hydrants	Emergency Services	Semi-annual/ annually See List 11	PM000034 Inspecting for Deterioration ^b and Leaks/Spills
Fire Pumps	Emergency Services	Weekly/annually See List 11	PM000026 Inspecting for Deterioration ^b , Leaks/Spills, valves, and panel lights
Fire Sprinkler Systems	Emergency Services	Monthly/ quarterly See List 11	PM000025 Inspecting for Deterioration ^b , Leaks/Spills, static pressures, and removable strainers
Fire and Emergency Response Trucks (Seagrave Fire Apparatus, Emergency One Apparatus, and Underground Rescue Truck)	Emergency Services	Weekly See List 11	PM000033 Inspecting for Mechanical Operability ^m , Deterioration ^b , Leaks/Spills, and Required Equipment ⁿ
Forklifts Used for Waste Handling (Electric and Diesel forklifts, Push-Pull Attachment)	Waste Handling	Preoperational See List 8	WP 05-WH1401, WP 05-WH1402, WP 05-WH1403, and WP 05-WH1412 Inspecting for Mechanical Operability ^m , Deterioration ^b , and On board fire suppression system
Hazardous Material Response Equipment	Emergency Services	Weekly See List 11	PM000033 Inspecting for Mechanical Operability ^m , Deterioration ^b , and Required Equipment ⁿ
Miners First Aid Station	Emergency Services	Quarterly See List 11	PM000035 Inspecting for Required Equipment ⁿ
Mine Pager Phones (between surface and underground)	Facility Operations	Monthly See List 3	WP 04-PC3017 Testing of PA and Underground Alarms and Mine Page Phones at essential locations

ANTICIPATED EARLIEST CLOSURE DATES FOR
THE UNDERGROUND HWDUs**

HWDU	OPERATIONS START	OPERATIONS END	CLOSURE START	CLOSURE END
PANEL 1	3/99	2/03	3/03	9/03 SEE NOTE 5
PANEL 2	3/03	6/05	7/05	1/06 SEE NOTE 5
PANEL 3	7/05	1/07	2/07	8/07 SEE NOTE 6
PANEL 4	1/07	1/09	2/09	8/09 <u>SEE NOTE 6</u>
PANEL 5	1/09	1/11	2/11	8/11 <u>SEE NOTE 6</u>
PANEL 6	1/11	1/13	2/13	8/13 <u>SEE NOTE 6</u>
PANEL 7	1/13	1/15	2/15	8/15 <u>SEE NOTE 6</u>
PANEL 8	1/15	1/17	2/17	8/17
PANEL 9	1/17	1/28	2/28	SEE NOTE 4
PANEL 10	1/28	9/30	10/30	SEE NOTE 4

NOTE 1: Only Panels 1 to 4 will be closed under the initial term of this permit. Closure schedules for Panels 5 through 10 are projected assuming new permits will be issued in 2009 and 2019.

NOTE 2: The point of closure start is defined as sixty (60) days following notification to the NMED of closure.

NOTE 3: The point of closure end is defined as one hundred eighty (180) days following placement of final waste in the panel.

NOTE 4: The time to close these areas may be extended depending on the nature and extent of the disturbed rock zone. The excavations that constitute these panels will have been opened for as many as forty (40) years so that the preparation for closure may take longer than the time allotted in Figure I-2. If this extension is needed, it will be requested as an amendment to the Closure Plan.

DRAFT
11-05-07

1 NOTE 5: The anticipated closure end date for Panels 1 and 2 is for installation of the 12-foot explosion
2 isolation wall. Final closure of Panels 1 and 2 will be completed as specified in this Permit no later January
3 2016 ~~June 30, 2009~~.

4
5 NOTE 6: The anticipated closure end date for Panel 3 through 7 is for initially blocking ventilation through
6 the closed panel. Final closure of Panel 3 through 7 will be completed as specified in this Permit no later
7 than January 2016 ~~June 30, 2009~~.

6 after completion of waste emplacement until final panel closure unless an explosion isolation
7 wall is installed.
8
9

10 N-3c Sampling and Analysis Methods
11

12 The VOC monitoring programs include a comprehensive VOC monitoring program established
13 at the facility; equipment, training, and documentation for VOC measurements are already in
14 place.
15

16 The method used for VOC sampling is based on the concept of pressurized sample collection
17 contained in the U.S. Environmental Protection Agency (EPA) Compendium Method TO-15
18 (EPA, 1999). The TO-15 sampling concept uses 6-liter SUMMA[®] passivated (or equivalent)
19 stainless-steel canisters to collect integrated air samples at each sample location. This
20 conceptual method will be used as a reference for collecting the samples at WIPP. The samples
21 will be analyzed using gas chromatography/mass spectrometry (GC/MS) under an established
22 QA/quality control (QC) program. Laboratory analytical procedures have been developed based
23 on the concepts contained in both TO-15 and 8260B. Section N-5 contains additional QA/QC
24 information for this project.
25

26 The TO-15 method is an EPA-recognized sampling concept for VOC sampling and speciation. It
27 can be used to provide integrated samples, or grab samples, and compound quantitation for a
28 broad range of concentrations. The sampling system can be operated unattended but requires
29 detailed operator training. This sampling technique is viable for use while analyzing the sample
30 using other EPA methods such as 8260B.
31

32 The field sampling systems will be operated in the pressurized mode. In this mode, air is drawn
33 through the inlet and sampling system with a pump. The air is pumped into an initially evacuated
34 SUMMA[®] passivated (or equivalent) canister by the sampler, which regulates the rate and
35 duration of sampling. The treatment of tubing and canisters used for VOC sampling effectively
36 seals the inner walls and prevents compounds from being retained on the surfaces of the
37 equipment. By the end of each sampling period, the canisters will be pressurized to about two
38 atmospheres absolute. In the event of shortened sampling periods or other sampling conditions,
39 the final pressure in the canister may be less than two atmospheres absolute. Sampling
40 duration will be approximately six hours, so that a complete sample can be collected during a
41 single work shift.
42

43 The canister sampling system and GC/MS analytical method are particularly appropriate for the
44 VOC Monitoring Programs because a relatively large sample volume is collected, and multiple

1 dilutions and reanalyses can occur to ensure identification and quantification of target VOCs
2 within the working range of the method. The contract-required quantitation limits (**CRQL**) are 5
3 parts per billion by volume (**ppbv**) or less for the nine target compounds. Consequently, low
4 concentrations can be measured. CRQLs are the EPA-specified levels of quantitation proposed
5 for EPA contract laboratories that analyze canister samples by GC/MS. For the purpose of this
6 plan, the CRQLs will be defined as the method reporting limits (**MRL**). The MRL is a function of
7 instrument performance, sample preparation, sample dilution, and all steps involved in the
8 sample analysis process.

9
10 Disposal room VOC monitoring system in open panels will employ the same canister sampling
11 method as used in the repository VOC monitoring. Passivated or equivalent sampling lines will
12 be installed in the disposal room as described in Section N-3a(2) and maintained once the room
13 is closed until the panel associated with the room is closed. The independent lines will run from
14 the sample inlet point to the individual sampler located in the access drift to the disposal panel.
15 The air will pass through dual particulate filters to prevent sample and equipment contamination.

16 N-3d(2) Sampling Schedule for Disposal Room VOC Monitoring

17
18
19 The disposal room sampling in open panels will occur once every two weeks, unless the need
20 to increase the frequency to weekly occurs in accordance with Permit Condition IV.F.3.c.

21 N-6 Sampling and Analysis Procedures for VOC Monitoring in Filled Panels

22
23
24 VOC Disposal Room monitoring in the filled panels, beginning with Panel 3, will be continued
25 until final panel closure. The Permittees will continue monitoring VOCs in Room 1 of each filled
26 panel monthly to assure worker safety and protection. Only VOCs in the adjacent closed room
27 (Room 1 in a filled panel) pose a health risk to workers in the immediate vicinity.

28
29 Samples will be collected using the subatmospheric pressure grab sampling technique
30 described in USEPA Method TO-15. This method uses an evacuated SUMMA[®] passivated
31 canister (or equivalent) that is under vacuum (0.05 mm Hg) to draw the air sample from the
32 sample lines into the canister. The sample lines will be purged prior to sampling to ensure that
33 a representative sample is collected. The passivation of tubing and canisters used for VOC
34 sampling effectively seals the inner walls and prevents compounds from being retained on the
35 surfaces of the equipment. By the end of each sampling period, the canisters will be near
36 atmospheric pressure.

37
38 The analytical procedures for VOC monitoring in filled panels will be the same as indicated in
39 Attachment N, Section N-4e.

DRAFT
11-05-07

1 N1-1 Introduction

2
3 This Permit Attachment describes the monitoring plan for hydrogen and methane generated in
4 filled rooms in underground disposal panels.

5
6 Monitoring for hydrogen and methane in Panels 3 through 7 until final panel closure is an
7 effective way to gather data to establish whether generation of these gases actually occurs and
8 if so, determine more realistic generation rates. More realistic generation rates may lead to
9 panel closure designs that are less complex than the current design. In addition, collecting data
10 under a monitoring program will provide data to assure worker safety during operation of the
11 repository. This plan includes the monitoring design, a description of sampling and analysis
12 procedures, quality assurance (QA) objectives, and reporting activities.

13
14 N1-2 Parameters to be Analyzed and Monitoring Design

15
16 The Permittees will monitor for hydrogen and methane in filled Panels 3 through 7 until final
17 panel closure.

18
19 Monitoring of filled panels will involve installing the following in each filled panel:

- 20 • a substantial barrier
21 • a steel bulkhead
22 • five additional monitoring locations.

23
24 The substantial barrier serves to protect the waste from events such as ground movement or
25 vehicle impacts. The substantial barrier will be constructed from available non-flammable
26 materials such as mined salt (Figure N1-1).

27
28 The bulkhead (Figure N1-2) serves to block ventilation in the filled panel and prevent personnel
29 access. The isolation barrier is constructed as a typical WIPP bulkhead with no access doors or
30 panels. The bulkhead will consist of a steel member frame covered with galvanized sheet
31 metal, and will not allow personnel access. Rubber conveyor belt will be used as a gasket to
32 seal the steel frame to the salt.. Over time it is possible that the bulkhead may be damaged by
33 creep closure around it. If the damage is such as to indicate a possible loss of functionality then
34 an additional bulkhead will be constructed outside of the original one.

35
36 The existing VOC monitoring lines will be used for sample collection in each disposal room for
37 Panels 3 through 7. The sample lines and their construction are shown in Figure N1-3.

38 In addition to the existing VOC monitoring lines, five more sampling locations will be used to
39 monitor for hydrogen and methane. These additional locations include:

- 40 • the inlet of room 1
41 • the waste side of the exhaust bulkhead,
42 • the accessible side of the exhaust bulkhead,
43 • the waste side of the intake bulkhead,
44 • the accessible side of the intake bulkhead.

DRAFT
11-05-07

1 These additional sampling locations (Figure N1-4) will use a single inlet sampling point placed
2 near the back. This will maximize the sampling efficiency for these lighter compounds.

3 4 N1-3 Sampling Frequency

5
6 Sampling frequency will vary depending upon the levels of hydrogen and methane that are
7 detected.

- 8
9
 - 10 • If monitored concentrations are below Action Level 1 as specified in Table
11 IV.F.5.a monitoring will be conducted monthly.
 - 12 • If monitored concentrations are above Action Level 1 as specified in Table
13 IV.F.5.a monitoring will be increased to weekly.

14 15 N1-4 Sampling Methodology

16
17 Samples for hydrogen and methane will be collected using subatmospheric pressure grab
18 sampling as described in Environmental Protection Agency (EPA) Compendium Method TO-15.
19 The TO-15 sampling method uses passivated stainless-steel sample canisters to collect
20 integrated air samples at each sample location. Flow rates and sampling duration may be
21 modified as necessary to meet data quality objectives.

22
23 Sample lines shall be purged prior to sample collection.

24 25 26 N1-5 Sampling Equipment

27 28 N1-5a SUMMA[®] Canisters

29
30 Stainless-steel canisters with passivated or equivalent interior surfaces will be used to collect
31 and store gas samples for hydrogen and methane analyses collected as part of the monitoring
32 processes. These canisters will be cleaned and certified prior to their use in a manner similar to
33 that described by Compendium Method TO-15. The vacuum of certified clean canisters will be
34 verified upon initiation of a sample cycle. Sampling will be conducted using subatmospheric
35 pressure grab sampling techniques as described in TO-15.

36 37 N1-5b Sample Tubing

38
39 Treated stainless steel tubing shall be used as a sample path and treatment shall prevent the
40 inner walls from absorbing contaminants.

41
42 Any loss of the ability to obtain a sample from a sample line will be evaluated.

43
44 The criteria used for evaluation are shown in Figure N1-5.

DRAFT
11-05-07

1 The Permittees will first suspect that a line is not useable when it is purged prior to sampling. If
2 the line cannot be purged, then it will not be used for sampling unless the line is a bulkhead line
3 that can be easily replaced. Replacement of bulkhead lines will occur before the next
4 scheduled sample. Non-bulkhead lines will be evaluated by first determining if adjacent
5 sampling lines are working. If the answer is no, then the previous sample from the failed line
6 will be examined. If the previous sample was between the first and second action levels, then
7 the explosion isolation wall will be installed since without the ability to monitor it is unknown
8 whether the area is approaching the second action level or decreasing. If the previous sample
9 was below the first action level then continued sampling is acceptable without the lost sample.

10
11 If an adjacent line is working, the concentrations measured in that line will be evaluated to
12 determine if it is statistically similar to the prior measurements from the lost line. If the sampling
13 results are statistically similar, the lines can be grouped. Statistical similarity will be determined
14 using the Student's "t" test to evaluate differences.

15
16 The magnitude of t will be compared to the critical t value from SW-846, Table 9-2 (EPA 1996),
17 for this statistical test.

18
19 If the lost line can be grouped with an adjacent line, no further action is necessary because the
20 unmonitored area is considered to be represented by the adjacent areas. If the lost sample line
21 cannot be grouped with an adjacent line, the previous concentration measurement will be
22 compared to the Action Levels. If the concentration is below Action Level 1 monitoring will
23 continue. If the concentration is between Action Level 1 and Action Level 2, the explosion
24 isolation wall will be installed in the panel.

25 26 N1-6 Sample Management

27
28 Sample containers shall be sealed and uniquely marked at the time of collection of the sample.
29 A Request-for-Analysis Form shall be completed to identify the sample canister number(s),
30 sample type, and type of analysis requested.

31 32 N1-7 Sampler Maintenance

33
34 Periodic maintenance for samplers and associated equipment shall be performed as
35 recommended by the manufacturer.

36 37 38 39 40 41 42 N1-8 Analytical Procedures

43
44 The samples will be analyzed using gas chromatography equipped with the appropriate detector
45 under an established QA/quality control (QC) program. Analysis of samples shall be performed

DRAFT
11-05-07

1 by a laboratory that the Permittees select and approve through established QA processes.

2
3 N1-9 Data Evaluation and Notifications

4
5 Analytical data from sampling events will be evaluated and, it will be determined whether the
6 sample concentrations of flammable gases exceed the Action Levels.

7
8 If any Action Level is exceeded, notification will be made to the NMED and the notification
9 posted to the WIPP web page and accessed through the email notification system within 7
10 calendar days of obtaining validated analytical data.

11
12 If any sampling line loss occurs, notification will be made to the NMED and the notification
13 posted to the WIPP web page and accessed through the email notification system within 7
14 calendar days of learning of a sampling line loss. After the evaluation of the impact of sampling
15 line loss as shown in Figure N1-5, notification will be made to the NMED and the notification
16 posted to the WIPP web page and accessed through the email notification system within 7
17 calendar days of completing the sampling line loss evaluation.
