Overview of the Permit Modification Request

This document contains one Class 2 Permit Modification Request (**PMR**) for the Waste Isolation Pilot Plant (**WIPP**) Hazardous Waste Facility Permit (**Permit**) Number NM4890139088-TSDF.

This PMR is being submitted by the U.S. Department of Energy Carlsbad Field Office and Washington TRU Solutions LLC, collectively referred to as the Permittees, in accordance with the WIPP Permit, Part 1, Condition 1.3.1 (20.4.1.900 New Mexico Administrative Code (**NMAC**) incorporating Title 40 Code of Federal Regulations (**CFR**) 270.42(b)). The modification provides for the following changes:

- Revise language to indicate when 35,000 standard cubic feet per minute (scfm) is required for worker entry into active rooms and when reporting is required.

The requested modification to the WIPP Permit and related supporting documents are provided in this PMR. The proposed modification to the text of the WIPP Permit has been identified using red text and a double underline and a ~~strikeout~~ font for deleted information. All direct quotations are indicated by italicized text. The following information specifically addresses how compliance has been achieved with the WIPP Permit requirement, Permit Part 1, Condition 1.3.1. for submission of this Class 2 PMR.

1. **20.4.1.900 NMAC (incorporating 40 CFR 270.42(b)(1)(i)) requires the applicant to describe the exact change to be made to the permit conditions and supporting documents referenced by the Permit.**

The Permittees are proposing the following changes in this PMR:

1. Add definition for a “filled room.”
2. Add clarifying language in Attachment A2, Section A2-2a(3), Attachment O, Section O-1, Section O-2, Section O-3, Section O-3b(2), Section O-3c(1) and Section O-5a to indicate that 35,000 scfm is required for worker entry into any active room that is adjacent to a filled room.
3. Modify the notification requirements when the ventilation requirements are not met.

The Table of Changes (Appendix A) and proposed text changes in redline ~~strikeout~~ (Appendix B) of this PMR describe each change that is being proposed. Appendix A provides a detailed list of changes by Permit section.

2. **20.4.1.900 NMAC (incorporating 40 CFR 270.42(b)(1)(ii)), requires the applicant to identify that the modification is a Class 2 modification.**

On May 20, 2011, the Permittees submitted a similar modification to the New Mexico Environment Department (**NMED**) requesting a determination of class. On June 15, 2011 the NMED responded that they believed that this request was a Class 2 modification as it was “*most similar*” to Item A.4.b of Appendix I in 40 CFR 270.42 which states: “*Changes in the frequency of or procedures for monitoring, reporting, sampling or maintenance activities by the*

permittee: other changes.” Therefore this modification request is being submitted as a Class 2 under Item A.4.b.

3. 20.4.1.900 NMAC (incorporating 40 CFR 270.42(b)(1)(iii)), requires the applicant to explain why the modification is needed.

The basis for this PMR is to improve the protection of operating personnel by reducing the time the workers must be present in the exhaust air of panels to adjust ventilation regulators. Permit Attachment A4, Section A4-4 states that “[t]he exhaust drift in the waste disposal area will normally not be used for personnel access.” This restriction minimizes the chance for exposure to emissions from the waste. This PMR proposes to use the active remote-handled (**RH**) transuranic (**TRU**) mixed waste disposal room to gain access to the ventilation louvers without requiring workers to travel the longer distances down the exhaust drift even if the ventilation flow rate in the RH TRU mixed waste disposal room is less than 35,000 scfm. Currently workers are required to routinely occupy the ventilation exhaust areas to adjust ventilation. This PMR proposes to ameliorate this circumstance by applying the restriction regarding access to rooms that is adjacent to a filled contact-handled (**CH**) TRU waste disposal room. This proposed change is consistent with the exposure modeling and the administrative history of the Permit as discussed below. This change will allow workers to enter the RH TRU mixed waste inlet air side in order to access the ventilation regulators even if there is less than 35,000 scfm of air present. This change does not waive any ventilation requirements imposed by the Mine Safety and Health Administration (**MSHA**).

There are times when it is necessary to enter an active disposal room in order to establish normal ventilation. One such event occurred in July 2011 when as the result of a power failure, normal ventilation was stopped. In such cases, the ventilation mode shifts to “Filtration Mode” whereby one 60,000 cubic feet per minute fan is operated and air from the underground is diverted through the HEPA filters as a precaution. In such cases, the process for restoring normal ventilation is to inspect the waste face to make sure there are no breached containers. Normally, this can be performed from the entry to the active room (i.e., from the intake drift at the room entrance). However, in the recent event, the waste face was not visible from this location, therefore, it was necessary to send workers into the room for the required inspection. Under the current Permit language, such an entry is not a noncompliance of the Permit because waste handling activity is not underway; however a notification per Attachment O was necessary. In order to assure such reentry activity can be performed after the Permit is modified, language is placed in Attachment O, Section O-3c(2) that specifically exempts entry for establishing normal ventilation (i.e., 35,000 scfm) from the requirement that ventilation already be at 35,000 scfm prior to entering. The language requires that such entry be noted in the log book so that clear documentation of such events is kept in the Operating Record for the facility.

Related to this, some clarification of the reporting requirement is proposed. Currently, there is a 7-day notification requirement whenever the Ventilation Requirements are not met. This is triggered after a monthly review of the ventilation records. It is not clear what purpose the notification requirement serves, since no action is triggered. The Permittees are proposing in place of the 7-day notification, which is usually reserved to situations which pose risk to human health or the environment, instances where the ventilation requirements are not achieved, be reported annually in the Mine Ventilation Rate Monitoring Annual Report. This is consistent with reporting “other noncompliance” annually as required by Permit Part 1, Condition 1.7.14. To this extent, the Permittees are proposing changes to the text in Permit Part 4, Condition 4.6.4.3 and Permit Attachment O, Sections O-3b(2) and O-5a.

Source of the 35,000 scfm Ventilation Requirement in the Permit:

When the Permittees prepared their Permit Application in 1996, the NMED requested that several exposure scenarios be examined to evaluate the potential releases of volatile organic compounds (VOCs) and the effects on underground workers (WIPP RCRA Part B Permit Application, DOE/WIPP 91-005, Revision 6 Appendix D9, Attachment 1). These scenarios involved a roof fall in an open room (i.e., one being actively filled with CH TRU mixed waste) and a closed room (i.e., a CH TRU mixed waste room that was filled with drums of waste and had ventilation barriers in place). Two other scenarios evaluated “normal operations” to determine risk to workers actively placing waste in CH TRU mixed waste rooms when no roof fall occurs. In all cases, the potentially exposed individual was an underground waste handler working in the active CH TRU mixed waste room. The four scenarios are shown in Figures 1 to 4 which are taken from the NMED’s written testimony submitted during the original Permit hearings in 1999 (NMED Direct Testimony Regarding Regulatory Process and Imposed Conditions” (HRM 98-04(P))). In all four cases, the NMED determined that the combination of the environmental performance standards (established through room-based limits) and the minimum ventilation of 35,000 scfm were sufficient to protect these workers. Hence, the Permit was issued with the condition that 35,000 scfm be maintained whenever workers are present in an active room (Permit Attachment O, multiple locations).

Applicability to RH TRU Mixed Waste Rooms:

At the time the Permit was issued in 1999, RH TRU waste was prohibited and RH TRU waste emplacements were not included in the NMED’s analysis. Rooms that are being filled with RH TRU waste represent one additional scenario as shown in Figure 5. As can be seen in Figure 5, the worker is unaffected by normal operations or a roof fall in the adjacent CH TRU mixed waste room and by any roof fall scenario in the adjacent closed room by virtue of the fact that the ventilation flow through the active CH TRU mixed waste room bypasses the active RH TRU mixed waste room. Volatile Organic Compound emissions from RH TRU waste itself are negligible due to the low volume of RH TRU waste being emplaced, and emplacement of RH in boreholes with shield plugs. This is supported by the room-based measurements made at the exhaust of the active RH TRU mixed waste room shown in Figure 6. This figure shows the measurements in Room 7 exhaust for Panels 5 and 6. These are the only cases where the Permittees measure emissions that are due to RH TRU mixed waste only. The values (through May 17, 2011) range from zero to 4.5 parts per billion (volume). The highest value is seven orders of magnitude below any room-based action level and is an indication that RH TRU mixed waste is contributing very little to overall concentration of carbon tetrachloride in the panels.

Appropriateness of the Proposed Changes:

The changes proposed in the PMR are based on the NMED record that indicates the concern for maintaining adequate ventilation is to protect workers from exposure to harmful concentrations of VOCs in the active CH TRU mixed waste room adjacent to a filled CH TRU mixed waste room during normal operations and in the event of a roof fall. These harmful concentrations are unlikely to occur in the RH TRU mixed waste rooms during normal operations or as the result of the roof fall. Therefore, the change specifically limits the condition to maintain 35,000 scfm to any active room that is adjacent to a filled disposal room when workers are present. A “filled room” is also defined so there is no confusion regarding this terminology. The change normally would apply to the room in a panel that is receiving CH TRU mixed waste and not to an RH TRU mixed waste disposal room. However, there may be circumstances when a room is filled with CH TRU mixed waste and there is remaining RH TRU

mixed waste to be emplaced in the next room. In such cases, the requirement for 35,000 scfm would apply to the RH TRU mixed waste room (i.e., the room adjacent to a filled disposal room).

Figure 7 shows the current and proposed worker pathways to adjust the ventilation regulators. Clearly, the pathway allowed by this proposed modification is significantly shorter and thereby reduces the time that a worker must be downstream of the emplaced waste.

4. **20.4.1.900 NMAC (incorporating 40 CFR 270.42 (b)(1)(iv)), requires the applicant to provide the applicable information required by 40 CFR 270.13 through 270.21, 270.62 and 270.63.**

Regulatory citations in this modification reference 20.4.1.900 NMAC (incorporating 40 CFR §§270.13-15) revised March, 2009. Title 40 CFR §§270.16 through 270.22, 270.62, 270.63 and 270.66 are not applicable at WIPP. Consequently, they are not included. Title 40 CFR §270.23 is applicable to the WIPP Hazardous Waste Disposal Units (**HWDUs**). This modification does not impact the conditions associated with the HWDUs.

5. **20.4.1.900 NMAC (incorporating 40 CFR 270.11(d)(1) and 40 CFR 270.30(k)), requires that any person signing under paragraph a and b must certify the document in accordance with 20.4.1.900 NMAC.**

The transmittal letter for this PMR contains the signed certification statement in accordance with Part 1, Condition 1.9 of the Permit.

Appendix B
Proposed Revised Permit Text

Proposed Revised Permit Text:1.5.19. Filled Room

“Filled Room” means a room in an Underground Hazardous Waste Disposal Unit as described in Permit Part 4 that will no longer receive CH TRU mixed waste for emplacement.

4.5.3.2. Ventilation

The Permittees shall maintain a minimum running annual average mine ventilation exhaust rate of 260,000 standard ft³/min and a minimum active room ventilation rate of 35,000 standard ft³/min when workers are present in ~~the~~ an active room adjacent to a filled room, as specified in Permit Attachment A2, Section A2-2a(3), “Subsurface Structures (Underground Ventilation System Description)” and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.601(c)).

4.6.4.3. ~~Notification~~ Evaluation Requirements

The Permittees shall calculate the running annual average mine ventilation exhaust rate on a monthly basis. In addition, the Permittees shall evaluate compliance with the minimum active room ventilation rate specified in Permit Section 4.5.3.2 on a monthly basis. ~~Whenever the evaluation of the mine ventilation monitoring program data identifies that the ventilation rates specified in Permit Section 4.5.3.2 have not been achieved, the~~ The Permittees shall notify the Secretary in writing ~~within seven calendar days~~ the annual report specified in Permit Section 4.6.4.2 whenever the evaluation of the mine ventilation monitoring program data identifies that the ventilation rates specified in Permit Section 4.5.3.2 have not been achieved.

A2-2a(3) Subsurface StructuresUnderground Ventilation System Description

At any given time during waste emplacement activities, there may be significant activities in multiple rooms in a panel. For example, one room may be receiving CH TRU mixed waste containers, another room may be receiving RH TRU mixed waste canisters, and the drilling of RH TRU mixed waste emplacement boreholes may be occurring in another room. The remaining rooms in a panel will either be completely filled with waste; be idle, awaiting waste handling operations; or being prepared for waste receipt. A minimum ventilation rate of 35,000 ft³ (990 m³) per

minute will be maintained in each room that is adjacent to a filled room where waste disposal is taking place when workers are present in the room. This quantity of air is required to support the numbers and types of diesel equipment that are expected to be in operation in the area, to support the underground personnel working in that area, and to exceed a minimum air velocity of 60 ft (18 m) per minute. The remainder of the air is needed in order to account for air leakage through inactive rooms.

Air will be routed into a panel from the intake side. Air is routed through the individual rooms within a panel using underground bulkheads and air regulators. Bulkheads are constructed by erecting framing of rectangular steel tubing and screwing galvanized sheet metal to the framing. Bulkhead members use telescoping extensions that are attached to framing and the salt which adjust to creep. Rubber or sheet metal attached to the bulkhead on one side and the salt on the other completes the seal of the ventilation. Where controlled airflow is required, a louver-style damper on a slide-gate (sliding panel) regulator is installed on the bulkhead. Personnel access is available through most bulkheads, and vehicular access is possible through selected bulkheads. Vehicle roll-up doors in the panel areas are not equipped with warning bells or strobe lights since these doors are to be used for limited periodic maintenance activities in the return air path. Flow is also controlled using brattice cloth barricades. These consist of chain link fence that is bolted to the salt and covered with brattice cloth; and are used in instances where the only flow control requirement is to block the air. A brattice cloth air barricade is shown in Figure A2-11. Ventilation will be maintained only in all active rooms within a panel until waste emplacement activities are completed and the panel-closure system is installed. The air will be routed simultaneously through all the active rooms within the panel. The Filled rooms that are filled with waste will be isolated from the ventilation system, while the adjacent rooms that are actively being filled will receive a minimum of 35,000 SCFM of air when workers are present to assure worker safety. After all rooms within a panel are filled, the panel will be closed using a closure system described Permit Attachment G and Permit Attachment G1.

O-1 Definitions

Restricted Access: If the required ventilation rate in an active disposal room that is adjacent to a filled room cannot be achieved or cannot be supported due to operational needs, access is restricted by the use of barriers, signs and postings, or individuals stationed at the entrance to the active disposal room when ventilation rates are below 35,000 scfm.

O-2 Objective

The objective of this plan is to describe how the ventilation requirements in the Permit will be met. This plan achieves this objective and documents the process by which the Permittees demonstrate compliance with the ventilation requirements by:

- Maintaining an annual running average of 260,000 scfm through the underground repository

- Maintaining a minimum of 35,000 scfm of air through the active disposal rooms that are adjacent to a filled room when workers are present in the rooms

O-3 Design and Procedures

This section describes the four basic processes that make up the mine ventilation rate monitoring plan:

- Test and Balance, a periodic re-verification of the satisfactory performance of the entire underground ventilation system and associated components
- Monitoring and calculation of the Running Annual Average of the Total Mine Airflow to verify achievement of the 260,000 scfm minimum requirement
- Monitoring of active disposal room(s) that are adjacent to a filled room to ensure a minimum flow of 35,000 scfm whenever workers are present in the room

O-3b(2) Calculation of the Running Annual Average of Total Mine Airflow

The use of an average value of 730 hours per month in the monthly average calculation is reasonable, given that all the numbers involved are very large and that the final use of the monthly average flow is in an annual calculation. ~~The Permittees will notify NMED within seven calendar days if either the minimum running annual average mine ventilation exhaust rate of 260,000 scfm or a minimum active room ventilation rate of 35,000 scfm when workers are present in the room are not achieved.~~

O-3c(1) Verification of ~~the Minimum Airflow for an~~ Active Disposal Room that is Adjacent to a Filled Room ~~Minimum Airflow~~

Whenever workers are present in an active room that is adjacent to a filled room, the Permittees shall verify the minimum airflow through that active disposal room(s) of 35,000 scfm at the start of each shift, any time there is an operational mode change, or if there is a change in the ventilation system configuration.

O-3c(2) Measurement and Calculation of the Active Waste Disposal Room Airflow

The operator shall compare the recorded acfm value with the minimum acfm value provided at the top of the log sheet. The airflow shall be re-checked and recorded whenever there is an operational mode change or a change in ventilation system configuration. Once the ventilation rate has been recorded and verified to be at least the required minimum, personnel access to the room is unrestricted in accordance with normal underground operating procedures. If the required ventilation rate cannot be achieved, or cannot be supported due to operational needs, access to the room shall be restricted. Those periods when active disposal room access is restricted shall be documented on the log sheet for that active disposal room. Entry to restricted access active disposal rooms for the purpose of establishing normal ventilation (e.g., after a power failure) will also be documented on the log sheet.

O-5a Reporting

The Permittees shall submit an annual report to NMED presenting the results of the data and analysis of the Mine Ventilation Rate Monitoring Plan. In the years that the Test and Balance is

performed, the Permittees will provide a summary of the results in the annual report. The Permittees shall calculate the running annual average mine ventilation rate on a monthly basis and evaluate compliance with the minimum active room ventilation rate specified in O-3b(2) on a monthly basis. ~~Whenever the evaluation of the mine ventilation monitoring program data identifies that the ventilation rates specified in O-3b(2) have not been achieved, the~~ The Permittees will ~~notify~~ report to the Secretary in writing within seven calendar days the annual report specified in Permit Section 4.6.3.2 whenever the evaluation of the mine ventilation monitoring program data identifies that the ventilation rates specified in O-3b(2) have not been achieved.

The Permittees shall calculate the running annual average mine ventilation rate on a monthly basis and evaluate compliance with the minimum ~~active room~~ ventilation rate for an active room that is adjacent to a filled room specified in O-3b(2) on a monthly basis. Whenever the evaluation of the mine ventilation monitoring program data identifies that the ventilation rates specified in O-3b(2) have not been achieved, the Permittees will notify the Secretary in writing within seven calendar days.
