I.D.13 Substantial Barrier

"Substantial barrier" means salt or other non-combustible material installed between the waste face and the bulkhead to protect the waste from events such as ground movement or vehicle impacts. The substantial barrier incorporates the chain link and brattice cloth room closure specified in the HWFP.

I.D.14 Bulkhead

"Bulkhead" means a steel structure, with flexible flashing, which is used to block ventilation.

I.D.15 Explosion Isolation Wall

"Explosion Isolation Wall" means the 12-foot wall intended as an explosion isolation device which is part of the approved panel closure.

I.D.16 Lower Explosive Limit

"Lower Explosive Limit" means the lowest concentration in air at which a gas will ignite and explode. The terms lower explosive limit and lower flammability limit are used interchangeably in fire science literature.

I.D.17 Filled Panel

"Filled Panel" means a hazardous waste disposal unit which will no longer receive TRU mixed waste.

1
2 IV.D.3. Ongoing Disposal Room VOC Monitoring in Panel 3 **Through 7**

3
4 The Permittees shall continue VOC monitoring in Room 1 of Panels 3 **through 7**
5 after completion of waste emplacement until final panel closure unless the
6 explosion isolation wall is installed in any of these panels.
7

8
9 IV.F.1 Geomechanical Monitoring

10
11
12 IV.F.4.b Reporting requirements - the Permittees shall submit to the
13 Secretary an annual report, beginning twelve (12) months after
14 issuance of this Permit, evaluating the geomechanical monitoring
15 program and shall include geomechanical data collected from
16 each Underground HWDU during the previous year, as specified
17 in Permit Attachment M2, Section M2-5b(2), "Geomechanical
18 Monitoring", and shall also include a map showing the current
19 status of HWDU mining. Also submitted at that time will be an
20 annual certification by a registered professional engineer
21 certifying the stability of any explosion isolation walls. The
22 Permittees will also notify the e-mail notification list within seven
23 (7) calendar days of submittal of this certification.
24

25 IV.F.5 Hydrogen and Methane Monitoring Program

26
27 IV.F.5.a Implementation of the Hydrogen and Methane Monitoring -
28 the Permittees shall implement the Hydrogen and Methane
29 Monitoring Program specified in Permit Attachment N1.

30
31 IV.F.5.b Notification Requirements -
32 The Permittees shall notify the Secretary in writing, within seven
33 (7) calendar days of obtaining validated analytical results,
34 whenever the concentration of hydrogen or methane in a filled
35 panel exceeds the Action Levels specified in Table IV.F.5.a below.
36
37 The Permittees will also notify the e-mail notification list within
38 seven (7) calendar days of obtaining validated analytical results if
39 the Action Levels are exceeded.

<u>Table IV.F.5.a - Action Levels for Hydrogen and Methane Monitoring</u>		
<u>Compound</u>	<u>Action Level 1</u>	<u>Action Level 2</u>
<u>Hydrogen</u>	<u>4,000 ppm</u>	<u>8,000 ppm</u>
<u>Methane</u>	<u>5,000 ppm</u>	<u>10,000 ppm</u>

IV.F.5.c Remedial Action - upon receiving validated analytical results that indicate that Action Level 1 has been reached or exceeded sampling will be increased to weekly. Upon receiving validated analytical results that indicate that Action Level 2 has been reached or exceeded in two consecutive weekly samples the explosion isolation wall will be installed.

IV.F.5.d Sampling Line Loss
Any loss of sampling lines will be evaluated as described in Section N1-5b, and notifications submitted to the Secretary and to the e-mail notification list within seven (7) calendar days of the discovery of loss of sampling line(s).

**TABLE D-1
INSPECTION SCHEDULE/PROCEDURES**

System/Equipment Name	Responsible Organization	Inspection ^a Frequency and Job Title of Personnel Normally Making Inspection	Procedure Number and Inspection Criteria
Air Intake Shaft Hoist	Underground Operations	Preoperational ^c See Lists 1b and c	WP 04-HO1004 Inspecting for Deterioration ^b , Safety Equipment, Communication Systems, and Mechanical Operability ^m in accordance with Mine Safety and Health Administration (MSHA) requirements
Ambulances (Surface and Underground) and related emergency supplies and equipment	Emergency Services	Weekly See List 11	PM000030 Inspecting for Mechanical Operability ^m , Deterioration ^b , and Required Equipment ⁿ
Adjustable Center of Gravity Lift Fixture	Waste Handling	Preoperational See List 8	WP 05-WH1410 Inspecting for Mechanical Operability ^m and Deterioration ^b
Backup Power Supply Diesel Generators	Facility Operations	Monthly See List 3	WP 04-ED1301 Inspecting for Mechanical Operability ^m and Leaks/Spills by starting and operating both generators. Results of this inspection are logged in accordance with WP 04-AD3008.
Facility Inspections (Water Diversion Berms)	Facility Engineering	Annually See List 4	WP 10-WC3008 Inspecting for Damage, Impediments to water flow, and Deterioration ^b
Central Monitoring Systems (CMS)	Facility Operations	Continuous See List 3	Automatic Self-Checking
Contact-Handled (CH) TRU Underground Transporter	Waste Handling	Preoperational See List 8	WP 05-WH1603 Inspecting for Mechanical Operability ^m , Deterioration ^b , and area around transporter clear of obstacles
Facility Transfer Vehicle	Waste Handling	Preoperational See List 8	WP 05-WH1406 Inspecting for Mechanical Operability ^m , Deterioration ^b , path clear of obstacles, and guards in the proper place
Exhaust Shaft	Underground Operations	Quarterly See List 1a	PM041099 Inspecting for Deterioration ^b and Leaks/Spills
Eye Wash and Shower Equipment	Equipment Custodian	Weekly See List 5	WP 12-IS1832 Inspecting for Deterioration ^b
		Semi-annually See List 2a	WP 12-IS1832 Inspecting for Deterioration ^b and Fluid Levels—Replace as Required
Fire Detection and Alarm System	Emergency Services	Semiannually See List 11	PM000027 Inspecting for Deterioration ^b , Operability of indicator lights and, underground fuel station dry chemical suppression system. Inspection is per NFPA 72

**TABLE D-1
INSPECTION SCHEDULE/PROCEDURES**

System/Equipment Name	Responsible Organization	Inspection ^a Frequency and Job Title of Personnel Normally Making Inspection	Procedure Number and Inspection Criteria
1 Fire Extinguishers'	Emergency Services	Monthly See List 11	PM000036 Inspecting for Deterioration ^b , Leaks/Spills, Expiration, seals, fullness, and pressure
2 Fire Hoses	Emergency Services	Annually (minimum) See List 11	PM000031 Inspecting for Deterioration ^b and Leaks/Spills
3 Fire Hydrants	Emergency Services	Semi-annual/ annually See List 11	PM000034 Inspecting for Deterioration ^b and Leaks/Spills
4 Fire Pumps	Emergency Services	Weekly/annually See List 11	PM000026 Inspecting for Deterioration ^b , Leaks/Spills, valves, and panel lights
5 Fire Sprinkler Systems	Emergency Services	Monthly/ quarterly See List 11	PM000025 Inspecting for Deterioration ^b , Leaks/Spills, static pressures, and removable strainers
6 Fire and Emergency 7 Response Trucks 8 (Seagrave Fire Apparatus, 9 Emergency One 10 Apparatus, and 11 Underground Rescue 12 Truck)	Emergency Services	Weekly See List 11	PM000033 Inspecting for Mechanical Operability ^m , Deterioration ^b , Leaks/Spills, and Required Equipment ⁿ
13 Forklifts Used for Waste 14 Handling (Electric and 15 Diesel forklifts, Push-Pull 16 Attachment)	Waste Handling	Preoperational See List 8	WP 05-WH1401, WP 05-WH1402, WP 05- WH1403, and WP 05-WH1412 Inspecting for Mechanical Operability ^m , Deterioration ^b , and On board fire suppression system
17 Hazardous Material 18 Response Equipment	Emergency Services	Weekly See List 11	PM000033 Inspecting for Mechanical Operability ^m , Deterioration ^b , and Required Equipment ⁿ
19 Miners First Aid Station	Emergency Services	Quarterly See List 11	PM000035 Inspecting for Required Equipment ⁿ
20 Mine Pager Phones 21 (between surface and 22 underground)	Facility Operations	Monthly See List 3	WP 04-PC3017 Testing of PA and Underground Alarms and Mine Page Phones at essential locations
23 MSHA Air Quality Monitor	Maintenance/ Underground Operations	Daily' See Lists 1 and 10	WP 12-IH1828 Inspecting for Air Quality Monitoring Equipment Functional Check
24 Perimeter Fence, Gates, 25 Signs	Security	Daily See List 6	PF0-011 Inspecting for Deterioration ^b and Posted Warnings

**TABLE D-1
INSPECTION SCHEDULE/PROCEDURES**

System/Equipment Name	Responsible Organization	Inspection ^a Frequency and Job Title of Personnel Normally Making Inspection	Procedure Number and Inspection Criteria
Personal Protective Equipment (not otherwise contained in emergency vehicles or issued to individuals): —Self-Contained Breathing Apparatus	Emergency Services	Weekly See List 11	PM000029 Inspecting for Deterioration ^b and Pressure
Public Address (and Intercom System)	Facility Operations	Monthly See List 3	WP 04-PC3017 Testing of PA and Underground Alarms and Mine Page Phones at essential locations Systems operated in test mode
Radio Equipment	Facility Operations	Daily ⁱ See List 3	Radios are operated daily and are repaired upon failure
Rescue Truck (Surface and Underground)	Emergency Services	Weekly See List 11	PM000030 and PM000033 Inspecting for Mechanical Operability ^m , Deterioration ^b , Leaks/Spills, and Required Equipment ⁿ
Salt Handling Shaft Hoist	Underground Operations	Preoperational See List 1b and c	WP 04-HO1002 Inspecting for Deterioration ^b , Safety Equipment, Communication Systems, and Mechanical Operability ^m in accordance with MSHA requirements
Self-Rescuers	Underground Operations	Quarterly See List 1c	WP 04-AU1026 Inspecting for Deterioration ^b and Functionality in accordance with MSHA requirements
Surface TRU Mixed Waste Handling Area ^k	Waste Handling	Preoperational or Weekly ^e See List 8	WP 05-WH1101 Inspecting for Deterioration ^b , Leaks/Spills, Required Aisle Space, Posted Warnings, Communication Systems, Container Condition, and Floor coating integrity
TRU Mixed Waste Decontamination Equipment	Waste Handling	Annually See List 8	WP 05-WH1101 Inspecting for Required Equipment ⁿ
Underground Openings— Roof Bolts and Travelways	Underground Operations	Weekly See List 1a	WP 04-AU1007 Inspecting for Deterioration ^b
Underground— Geomechanical Instrumentation System (GIS)	Geotechnical Engineering	Monthly See List 9	WP 07-EU1301 Inspecting for Deterioration ^b
Underground TRU Mixed Waste Disposal Area	Waste Handling	Preoperational See List 8	WP 05-WH1810 Inspecting for Deterioration ^b , Leaks/Spills, mine pager phones, equipment, unobstructed access, signs, debris, and ventilation

**TABLE D-1
INSPECTION SCHEDULE/PROCEDURES**

System/Equipment Name	Responsible Organization	Inspection ^a Frequency and Job Title of Personnel Normally Making Inspection	Procedure Number and Inspection Criteria
Uninterruptible Power Supply (Central UPS)	Facility Operations	Daily See List 3	WP 04-ED1542 Inspecting for Mechanical Operability ^m and Deterioration ^b with no malfunction alarms. Results of this inspection are logged in accordance with WP 04-AD3008.
TDOP Upender	Waste Handling	Preoperational See List 8	WP 05-WH1010 Inspecting for Mechanical Operability ^m and Deterioration ^b
Vehicle Siren	Emergency Services	Weekly See List 11	Functional Test included with inspection of the Ambulances, Fire Trucks, and Rescue Trucks
Ventilation Exhaust	Maintenance Operations	Quarterly See List 10	IC041098 Check for Deterioration ^b and Calibration of Mine Ventilation Rate Monitoring Equipment
Waste Handling Cranes	Waste Handling	Preoperational See List 8	WP 05-WH1407 Inspecting for Mechanical Operability ^m , Deterioration ^b , and Leaks/Spills
Waste Hoist	Underground Operations	Preoperational See List 1b and c	WP 04-HO1003 Inspecting for Deterioration ^b , Safety Equipment, Communication Systems, and Mechanical Operability ^m , Leaks/Spills, in accordance with MSHA requirements
Water Tank Level	Facility Operations	Daily See List 3	SDD-WD00 Inspecting for Deterioration ^b , and water levels. Results of this inspection are logged in accordance with WP 04-AD3008.
Push-Pull Attachment	Waste Handling	Preoperational See List 8	WP 05-WH1401 Inspecting for Damage and Deterioration ^b
Trailer Jockey	Waste Handling	Preoperational See List 8	WP 05-WH1405 Inspecting for Mechanical Operability ^m and Deterioration ^b
<u>Explosion Isolation Walls</u>	<u>Underground Operations</u>	<u>Quarterly</u> <u>See List 1</u>	<u>Integrity and Deterioration^b of Accessible Areas</u>
<u>Bulkhead in Filled Panels</u>	<u>Underground Operations</u>	<u>Monthly</u> <u>See List 1</u>	<u>Integrity and Deterioration^b of Accessible Areas</u>

1 I-1d(1) Schedule for Panel Closure
2

3 The anticipated schedule for the closure of the underground HWDUs known as Panels 3
4 through 8 is shown in Figure I-2. This schedule assumes there will be little contamination within
5 the exhaust drift of the panel. Underground HWDUs should be ready for closure according to
6 the schedule in Table I-1. These dates are estimates for planning and permitting purposes.
7 Actual dates may vary depending on the availability of waste from the generator sites.
8

9 In the schedule in Figure I-2, notification of intent to close occurs thirty (30) days before placing
10 the final waste in a panel. Once a panel is full, the Permittees will initially block ventilation
11 through the panel as described in Permit Attachment M2 and then will assess the closure area
12 for ground conditions and contamination so that a definitive schedule and closure design can be
13 determined. If as the result of this assessment the Permittees determine that a panel closure
14 cannot be emplaced in accordance with the schedule in this Closure Plan, a modification will be
15 submitted requesting an extension to the time for closure.
16

17 The Permittees will initially block ventilation through Panel 2 as described in Permit Attachment
18 M2 once Panel 2 is full to ensure continued protection of human health and the environment.
19 The Permittees will then install the explosion isolation wall portion of the panel closure system
20 that is described in Permit Attachment I1, Section 3.3.2, Explosion-and Construction-Isolation
21 Walls. Construction of the explosion isolation wall will not exceed 180 days after the last receipt
22 of waste in Panel 2. Final closure of Panels 1 and 2 will be completed as specified in this Permit
23 no later than January 2016 ~~June 30, 2009~~.
24

25 To ensure continued protection of human health and the environment, the Permittees will
26 initially block ventilation through Panel 3 as described in Permit Attachment M2, Section M2-
27 2a(3), after waste disposal in Panel 3 has been completed. The Permittees shall continue VOC
28 monitoring in Panel 3 until final panel closure. If the measured concentration, as confirmed by a
29 second sample, of any VOC in Panel 3 exceeds the "95% Actino Level" in Module IV, Table
30 IV.F.3.b, the Permittees will initiate closure of Panel 3 by installing the 12-foot explosion
31 isolation wall as described in Section 1-1e(1) and submit a Class 1* permit modification request
32 to extend Panel 3 closure, if necessary. Regardless of the outcome of disposal room VOC
33 monitoring, final closure of Panel 3 will be completed as specified in this Permit no later than
34 January 2016 ~~June 30, 2009~~.
35

**TABLE I-1
ANTICIPATED EARLIEST CLOSURE DATES FOR
THE UNDERGROUND HWDUs**

HWDU	OPERATIONS START	OPERATIONS END	CLOSURE START	CLOSURE END
PANEL 1	3/99	2/03	3/03	9/03 SEE NOTE 5
PANEL 2	3/03	6/05	7/05	1/06 SEE NOTE 5
PANEL 3	7/05	1/07	2/07	8/07 SEE NOTE 6
PANEL 4	1/07	1/09	2/09	8/09 <u>SEE NOTE 6</u>
PANEL 5	1/09	1/11	2/11	8/11 <u>SEE NOTE 6</u>
PANEL 6	1/11	1/13	2/13	8/13 <u>SEE NOTE 6</u>
PANEL 7	1/13	1/15	2/15	8/15 <u>SEE NOTE 6</u>
PANEL 8	1/15	1/17	2/17	8/17
PANEL 9	1/17	1/28	2/28	SEE NOTE 4
PANEL 10	1/28	9/30	10/30	SEE NOTE 4

NOTE 1: Only Panels 1 to 4 will be closed under the initial term of this permit. Closure schedules for Panels 5 through 10 are projected assuming new permits will be issued in 2009 and 2019.

NOTE 2: The point of closure start is defined as sixty (60) days following notification to the NMED of closure.

NOTE 3: The point of closure end is defined as one hundred eighty (180) days following placement of final waste in the panel.

NOTE 4: The time to close these areas may be extended depending on the nature and extent of the disturbed rock zone. The excavations that constitute these panels will have been opened for as many as forty (40) years so that the preparation for closure may take longer than the time allotted in Figure I-2. If this extension is needed, it will be requested as an amendment to the Closure Plan.

1

5
6
7
8
9
10

NOTE 5: The anticipated closure end date for Panels 1 and 2 is for installation of the 12-foot explosion isolation wall. Final closure of Panels 1 and 2 will be completed as specified in this Permit no later than January 2016 ~~June 30, 2009~~.

NOTE 6: The anticipated closure end date for Panel 3 through 7 is for initially blocking ventilation through the ~~closed~~ filled panel. Final closure of Panel 3 through 7 will be completed as specified in this Permit no later than January 2016 ~~June 30, 2009~~.

7 wall is installed.
8
9

10 N-3c Sampling and Analysis Methods
11

12 The VOC monitoring programs include a comprehensive VOC monitoring program established
13 at the facility; equipment, training, and documentation for VOC measurements are already in
14 place.
15

16 The method used for VOC sampling is based on the concept of pressurized sample collection
17 contained in the U.S. Environmental Protection Agency (**EPA**) Compendium Method TO-15
18 (EPA, 1999). The TO-15 sampling concept uses 6-liter SUMMA[®] passivated (or equivalent)
19 stainless-steel canisters to collect integrated air samples at each sample location. This
20 conceptual method will be used as a reference for collecting the samples at WIPP. The samples
21 will be analyzed using gas chromatography/mass spectrometry (**GC/MS**) under an established
22 QA/quality control (**QC**) program. Laboratory analytical procedures have been developed based
23 on the concepts contained in both TO-15 and 8260B. Section N-5 contains additional QA/QC
24 information for this project.
25

26 The TO-15 method is an EPA-recognized sampling concept for VOC sampling and speciation. It
27 can be used to provide integrated samples, or grab samples, and compound quantitation for a
28 broad range of concentrations. The sampling system can be operated unattended but requires
29 detailed operator training. This sampling technique is viable for use while analyzing the sample
30 using other EPA methods such as 8260B.
31

32 The field sampling systems will be operated in the pressurized mode. In this mode, air is drawn
33 through the inlet and sampling system with a pump. The air is pumped into an initially evacuated
34 SUMMA[®] passivated (or equivalent) canister by the sampler, which regulates the rate and
35 duration of sampling. The treatment of tubing and canisters used for VOC sampling effectively
36 seals the inner walls and prevents compounds from being retained on the surfaces of the
37 equipment. By the end of each sampling period, the canisters will be pressurized to about two
38 atmospheres absolute. In the event of shortened sampling periods or other sampling conditions,
39 the final pressure in the canister may be less than two atmospheres absolute. Sampling
40 duration will be approximately six hours, so that a complete sample can be collected during a
41 single work shift.
42

43 The canister sampling system and GC/MS analytical method are particularly appropriate for the
44 VOC Monitoring Programs because a relatively large sample volume is collected, and multiple
45 dilutions and reanalyses can occur to ensure identification and quantification of target VOCs

1 within the working range of the method. The contract-required quantitation limits (**CRQL**) are 5
2 parts per billion by volume (**ppbv**) or less for the nine target compounds. Consequently, low
3 concentrations can be measured. CRQLs are the EPA-specified levels of quantitation proposed
4 for EPA contract laboratories that analyze canister samples by GC/MS. For the purpose of this
5 plan, the CRQLs will be defined as the method reporting limits (**MRL**). The MRL is a function of
6 instrument performance, sample preparation, sample dilution, and all steps involved in the
7 sample analysis process.

8
9 Disposal room VOC monitoring system in open panels will employ the same canister sampling
10 method as used in the repository VOC monitoring. Passivated or equivalent sampling lines will
11 be installed in the disposal room as described in Section N-3a(2) and maintained once the room
12 is closed until the panel associated with the room is closed. The independent lines will run from
13 the sample inlet point to the individual sampler located in the access drift to the disposal panel.
14 The air will pass through dual particulate filters to prevent sample and equipment contamination.

15 16 N-3d(2) Sampling Schedule for Disposal Room VOC Monitoring

17
18 The disposal room sampling in open panels will occur once every two weeks, unless the need
19 to increase the frequency to weekly occurs in accordance with Permit Condition IV.F.3.c.

20 21 N-6 Sampling and Analysis Procedures for VOC Monitoring in Filled Panels

22
23 VOC Disposal Room monitoring in the filled panels, beginning with Panel 3, will be continued
24 until final panel closure unless an explosion isolation wall is installed. The Permittees will
25 continue monitoring VOCs in Room 1 of each filled panel monthly to assure worker safety and
26 protection. Only VOCs in the adjacent closed room (Room 1 in a filled panel) pose a potential
27 health risk to workers in the immediate vicinity.

28
29 Samples will be collected using the subatmospheric pressure grab sampling technique
30 described in USEPA Method TO-15. This method uses an evacuated SUMMA[®] passivated
31 canister (or equivalent) that is under vacuum (0.05 mm Hg) to draw the air sample from the
32 sample lines into the canister. The sample lines will be purged prior to sampling to ensure that
33 a representative sample is collected. The passivation of tubing and canisters used for VOC
34 sampling effectively seals the inner walls and prevents compounds from being retained on the
35 surfaces of the equipment. By the end of each sampling period, the canisters will be near
36 atmospheric pressure.

37
38 The analytical procedures for VOC monitoring in filled panels will be the same as indicated in
39 Attachment N, Section N-4e.

1 N1-1 Introduction

2
3 This Permit Attachment describes the monitoring plan for hydrogen and methane generated in
4 filled rooms in hazardous waste disposal units (HWDUs) 3 through 7, also referred to as Panels
5 3 through 7.

6
7 Monitoring for hydrogen and methane in Panels 3 through 7 until final panel closure unless an
8 explosion isolation wall is installed may be an effective way to gather data to establish realistic
9 gas generation rates. This plan includes the monitoring design, a description of sampling and
10 analysis procedures, quality assurance (QA) objectives, and reporting activities.

11
12 N1-2 Parameters to be Analyzed and Monitoring Design

13
14 The Permittees will monitor for hydrogen and methane in filled Panels 3 through 7 until final
15 panel closure unless an explosion isolation wall is installed.

16
17 Monitoring of filled panels will involve installing the following in each filled panel:

- 18 • substantial barriers
- 19 • bulkheads
- 20 • five additional monitoring locations.

21
22 The substantial barrier serve to protect the waste from events such as ground movement or
23 vehicle impacts. The substantial barrier will be constructed from available non-flammable
24 materials such as mined salt (Figure N1-1).

25
26 The bulkheads (Figure N1-2) serves to block ventilation at the intake and exhaust of the filled
27 panel and prevent personnel access. The bulkhead is constructed as a typical WIPP bulkhead
28 with no access doors or panels. The bulkhead will consist of a steel member frame covered
29 with galvanized sheet metal, and will not allow personnel access. Rubber conveyor belt will be
30 used as a gasket to attach the steel frame to the salt thereby providing an effective yet flexible
31 blockage to ventilation air. Over time it is possible that the bulkhead may be damaged by creep
32 closure around it. If the damage is such as to indicate a possible loss of functionality then the
33 bulkhead will be repaired or an additional bulkhead will be constructed outside of the original
34 one.

35
36 The existing VOC monitoring lines will be used for sample collection in each disposal room for
37 Panels 3 through 7. The sample lines and their construction are shown in Figure N1-3.
38 In addition to the existing VOC monitoring lines, five more sampling locations will be used to
39 monitor for hydrogen and methane. These additional locations include:

- 40 • the intake of room 1
- 41 • the waste side of the exhaust bulkhead,
- 42 • the accessible side of the exhaust bulkhead,
- 43 • the waste side of the intake bulkhead,
- 44 • the accessible side of the intake bulkhead.

45
46 These additional sampling locations (Figure N1-4) will use a single inlet sampling point placed

1 near the back. This will maximize the sampling efficiency for these lighter compounds.

2
3 N1-3 Sampling Frequency

4
5 Sampling frequency will vary depending upon the levels of hydrogen and methane that are
6 detected.

- 7
8
 - 9 • If monitored concentrations are below Action Level 1 as specified in Table
10 IV.F.5.a monitoring will be conducted monthly.
 - 11 • If monitored concentrations are above Action Level 1 as specified in Table
12 IV.F.5.a monitoring will be increased to weekly.

13
14 N1-4 Sampling Methodology

15
16 Samples for hydrogen and methane will be collected using subatmospheric pressure grab
17 sampling as described in Environmental Protection Agency (EPA) Compendium Method TO-15.
18 The TO-15 sampling method uses passivated stainless-steel sample canisters to collect
19 integrated air samples at each sample location. Flow rates and sampling duration may be
20 modified as necessary to meet data quality objectives.

21
22 Sample lines shall be purged prior to sample collection.

23
24
25 N1-5 Sampling Equipment

26
27 N1-5a SUMMA[®] Canisters

28
29 Stainless-steel canisters with passivated or equivalent interior surfaces will be used to collect
30 and store gas samples for hydrogen and methane analyses collected as part of the monitoring
31 processes. These canisters will be cleaned and certified prior to their use in a manner similar to
32 that described by Compendium Method TO-15. The vacuum of certified clean canisters will be
33 verified upon initiation of a sample cycle. Sampling will be conducted using subatmospheric
34 pressure grab sampling techniques as described in TO-15.

35
36 N1-5b Sample Tubing

37
38 Treated stainless steel tubing shall be used as a sample path and treatment shall prevent the
39 inner walls from absorbing contaminants.

40
41 Any loss of the ability to purge a sample line will be evaluated.

42
43 The criteria used for evaluation are shown in Figure N1-5.

44
45 The Permittees will first suspect that a line is not useable when it is purged prior to sampling. If
46 the line cannot be purged, then it will not be used for sampling unless the line is a bulkhead line

1 that can be easily replaced. Replacement of bulkhead lines will occur before the next
2 scheduled sample. Non-bulkhead lines will be evaluated by first determining if adjacent
3 sampling lines are working. If the answer is no, then the previous sample from the failed line
4 will be examined. If the previous sample was between the first and second action levels, then
5 the explosion isolation wall will be installed since without the ability to monitor it is unknown
6 whether the area is approaching the second action level or decreasing. If the previous sample
7 was below the first action level then continued sampling is acceptable without the lost sample.

8
9 If an adjacent line is working, the prior concentrations measured in that line will be evaluated to
10 determine if it is statistically similar to the prior measurements from the lost line. If the prior
11 sampling results are statistically similar, the lines can be grouped. Statistical similarity will be
12 determined using the Student's "t" test to evaluate differences.

13
14 The magnitude of t will be compared to the critical t value from SW-846, Table 9-2 (EPA 1996),
15 for this statistical test.

16
17 If the lost line can be grouped with an adjacent line, no further action is necessary because the
18 unmonitored area is considered to be represented by the adjacent areas. If the lost sample line
19 cannot be grouped with an adjacent line, the previous concentration measurement will be
20 compared to the Action Levels. If the concentration is below Action Level 1 monitoring will
21 continue. If the concentration is between Action Level 1 and Action Level 2, the explosion
22 isolation wall will be installed in the panel.

23 24 N1-6 Sample Management

25
26 Sample containers shall be sealed and uniquely marked at the time of collection of the sample.
27 A Request-for-Analysis Form shall be completed to identify the sample canister number(s),
28 sample type, and type of analysis requested.

29 30 N1-7 Analytical Procedures

31
32 The samples will be analyzed using gas chromatography equipped with the appropriate detector
33 under an established QA/quality control (QC) program. Analysis of samples shall be performed
34 by a laboratory that the Permittees select and approve through established QA processes.

35 36 N1-8 Data Evaluation and Notifications

37
38 Analytical data from sampling events will be evaluated to determine whether the sample
39 concentrations of flammable gases exceed the Action Levels.

40
41 If any Action Level is exceeded, notification will be made to the NMED and the notification
42 posted to the WIPP web page and accessed through the email notification system within 7
43 (seven) calendar days of obtaining validated analytical data.

44
45 If any sampling line loss occurs, notification will be made to the NMED and the notification
46 posted to the WIPP web page and accessed through the email notification system within 7

(seven) calendar days of learning of a sampling line loss. After the evaluation of the impact of sampling line loss as shown in Figure N1-5, notification will be made to the NMED and the notification posted to the WIPP web page and accessed through the email notification system within 7 (seven) calendar days of completing the sampling line loss evaluation.

NOTES

1. CONFIGURATION AND PLACEMENT OF THE SUBSTANTIAL BARRIER AND THE BULKHEAD DICTATED BY AS-FOUND (FIELD) CONDITIONS, AS DESIGNATED BY THE COGNIZANT ENGINEER.
2. SUBSTANTIAL BARRIER MATERIAL WILL CONSIST OF RUN-OF-MINE SALT OR OTHER SUITABLE NON-FLAMMABLE MATERIAL AS DESIGNATED BY THE COGNIZANT ENGINEER.
3. SUBSTANTIAL BARRIER MATERIAL SHOULD BE AGAINST THE WASTE FACE. THE HEIGHT OF THE SUBSTANTIAL BARRIER NEAR THE WASTE WILL BE AT LEAST EQUAL TO THE HEIGHT OF THE BOTTOM OF THE TOP ROW OF WASTE.
4. DIMENSIONS INDICATED ARE MINIMUMS. THE HEIGHT OF THE SUBSTANTIAL BARRIER IS MEASURED AT THE WASTE FACE. THE LENGTH OF THE SUBSTANTIAL BARRIER IS MEASURED FROM THE BOTTOM OF THE WASTE FACE TO THE TOE OF THE SUBSTANTIAL BARRIER MATERIAL.
