1.0 INTRODUCTION

The Waste Isolation Pilot Plant (WIPP), located in southeastern New Mexico, has been developed by the U.S. Department of Energy (DOE) for the geologic (deep underground) disposal of transuranic (TRU) waste. Containment of TRU waste at the WIPP is regulated by the U.S. Environmental Protection Agency (EPA) according to the regulations set forth in Title 40 of the Code of Federal Regulations (CFR), Part 191 (U.S. EPA 1993). The DOE demonstrates compliance with the containment requirements according to the Certification Criteria in Title 40 CFR Part 194 (U.S. EPA 1996) by means of performance assessment (PA) calculations performed by Sandia National Laboratories (SNL). WIPP PA calculations estimate the probability and consequence of potential radionuclide releases from the repository to the accessible environment for a regulatory period of 10,000 years after facility closure. The models are maintained and updated with new information as part of a recertification process that occurs at five-year intervals after the first waste is received at the site.

PA calculations were included in the 1996 Compliance Certification Application (CCA) (U.S. DOE 1996), and in a subsequent Performance Assessment Verification Test (PAVT) (MacKinnon and Freeze 1997a, 1997b and 1997c). Based in part on the CCA and PAVT PA calculations, the EPA certified that the WIPP met the containment criteria in the regulations and was approved for disposal of transuranic waste in May 1998 (U.S. EPA 1998). PA calculations were also an integral part of the 2004 Compliance Recertification Application (CRA-2004) (U.S. DOE 2004). During their review of the CRA-2004, the EPA requested an additional PA calculation, referred to as the CRA-2004 Performance Assessment Baseline Calculation (PABC) (Leigh et al. 2005), be conducted with modified assumptions and parameter values (Cotsworth 2005).

Since the CRA-2004 PABC, additional PA calculations were completed for and documented in the 2009 Compliance Recertification Application (CRA-2009). The CRA-2009 PA resulted from continued review of the CRA-2004 PABC, including a number of technical changes and corrections, as well as updates to parameters and improvements to the PA computer codes (Clayton et al. 2008). The EPA has requested that additional information, which was received between the commencement of the CRA-2009 PA (December 2007) and the submittal of the CRA-2009 (March 2009), be included in an additional PA calculation (Cotsworth 2009), referred to as the CRA-2009 Performance Assessment Baseline Calculation (PABC-2009). The PABC-2009 analysis is guided by AP-145 (Clayton 2009a). This report documents the parameters used for the PABC-2009.

This document contains information on the parameters used by PA codes. This document includes a listing of the added (see Table 1) and modified (see Table 2) parameters between the CRA-2009 and the PABC-2009, the sampled values for LHS sampled parameters (see Table 4), the fixed-value parameters used in the PA codes (see Table 5 through Table 38) and the parameters relating to the TRU waste inventory (see Table 39 and Table 40). For additional information regarding all parameters, readers are referred to the parameter supporting information packages, which are contained in the SNL WIPP Records Center located at the SNL office in Carlsbad, New Mexico.

2.0 PARAMETER DEVELOPMENT PROCESS

The development of parameter values is controlled by the application of NP Parameters (NP 9-2, Chavez 2006). The process includes documentation of parameter development by those responsible for completion of a particular experimental investigation, development of a system design, or by staff involved in the PA modeling process. All of the references pertaining to parameter selection are contained within the three levels of parameter and data documentation: (1) Parameter Data Entry Form NP-9-2-1, (2) Analysis records packages, and (3) supporting data records packages.

The Parameter Data Entry Form is the highest-level record documenting parameter development that includes application of statistics and interpretations. The Parameter Data Entry Forms include a justification section, which is a pointer to supporting information including, where applicable, the Analysis plan and source document. All values provided in this attachment were derived from the WIPP PA parameter database. The numbers from the WIPP PA parameter database may differ slightly from those contained in the Parameter Data Entry Forms because of rounding.

The parameter supporting information package includes references to related information, such as Analysis Plans, SAND reports, test plans, and related Electronic Records Management System (ERMS) file codes, and, where applicable, a summary on the experimental data collection (that is, method used, assumptions made in testing, and interpretation). The parameter supporting information packages point to the data records packages contain information such as the raw data, analysis, and data interpretation.

Each Parameter Data Entry Form and parameter supporting information package are assigned unique ERMS numbers. Copies of the Parameter Data Entry Forms and parameter supporting information packages are maintained in the SNL WIPP Records Center.

3.0 PARAMETER DISTRIBUTIONS

Probability distributions are used to characterize the uncertainty concerning the value of a parameter. Numbers that characterize a particular distribution include the range, the mean, median, and mode (only for triangular distributions).

- **Range.** The range of a distribution can be denoted by (a,b), a pair of numbers in which a and b are minimum and maximum values of the parameter, respectively.
- **Mean.** The expectation of a random variable: i.e., the sum (or integral) of the product of the variable and the probability distribution function (PDF) over the range of the variable. There is sample mean and mean: The mean, μ , of a distribution is one measure of the central tendency of a distribution, analogous to the arithmetic average of a series of numbers. The sample mean, \bar{x} , is the arithmetic average of value in an empirical data set.
- **Median.** The value of a random variable at which its cumulative distribution function (CDF) takes the value 0.5; i.e., the 50th percentile point.
- **Mode.** The value of a random variable at which its probability distribution function (PDF) takes its maximum value. The mode of a set of data is the value in the set that occurs most often.

Distributions used to characterize uncertainty in parameters of the PA include: uniform, cumulative, triangular, Student's-t, delta, normal, loguniform, logcumulative, lognormal, and constant.

3.1 UNIFORM DISTRIBUTION

Use of the uniform distribution is appropriate when all that is known about a parameter is its range (a,b); the uniform distribution is the Maximum Entropy distribution under these circumstances (Tierney 1990).

Density Function:
$$f(x) = \frac{1}{B - A} \quad A \leq x \leq B \quad (1)$$

Distribution Function:
$$F(x) = \frac{x - A}{B - A} \quad A \leq x \leq B \quad (2)$$

Expected Value:
$$E(X) = \frac{A + B}{2} \quad (3)$$

Variance:
$$V(X) = \frac{(B - A)^2}{12} \quad (4)$$

Median:
$$X_{0.5} = E(X) \quad (5)$$

3.2 CUMULATIVE DISTRIBUTION

A cumulative distribution (also called a constructed distribution) is described by a set of N ordered pairs:

$$(x_1, 0), (x_2, P_2), (x_3, P_3), \dots, (x_N, 1) \{i.e., P_1 = 0 \text{ and } P_N = 1 \text{ always}\} \quad (6)$$

where $x_1 < x_2 < x_3 < \dots < x_N$ and $0 < P_2 < P_3 < \dots < P_{N-1} < 1$.

The cumulative distribution takes its name from the fact that it closely resembles the empirical CDF obtained by plotting the empirical percentiles of the data set $(x_1, x_2, x_3, \dots, x_N)$ (Blom 1989, p. 216). The cumulative distribution used here is the result of plotting the subjectively determined percentile points $(x_1, P_1), (x_2, P_2), (x_3, P_3) \dots$, that arise in a formal elicitation of expert opinion concerning the form of the distribution of the parameter in question.

The cumulative distribution is the Maximum Entropy distribution associated with a set of percentile points $(x_1, P_1), (x_2, P_2), \dots, (x_N, P_N)$, no matter how that set of percentile points is obtained (that is, independent of whether the points are empirically or subjectively derived) (Tierney 1990).

Because of the nature of the data, the PDF for this distribution takes the form:

$$P(\xi) = \begin{cases} 0 & \text{if } \xi < x_1 \\ \frac{P_n - P_{n-1}}{x_n - x_{n-1}} & \text{if } x_{n-1} \leq \xi \leq x_n, n = 2, 3, \dots, N \\ 0 & \text{if } \xi \geq x_N \end{cases} \quad (7)$$

and so the CDF takes the form:

$$P_r [X \leq \xi] \approx \Pi(\xi) = \begin{cases} 0 & \text{if } \xi < x_1 \\ P_{n-1} + \frac{(P_n - P_{n-1})(\xi - x_{n-1})}{(x_n - x_{n-1})} & \text{if } \frac{x_{n-1} \leq \xi \leq x_n}{n=2, 3, \dots, N} \\ 1 & \text{if } \xi \geq x_N \end{cases} \quad (8)$$

Expected Value: $E(X) = \sum_{n=2}^N (P_n - P_{n-1}) \frac{(x_n + x_{n-1})}{2} \quad (9)$

Variance: $V(X) = \sum_{n=2}^N (P_n - P_{n-1}) \frac{(x_n^2 + x_n x_{n-1} + x_{n-1}^2)}{3} - \{E(X)\}^2 \quad (10)$

$$\text{Median: } x_{0.50} = x_{m-1} + (x_m - x_{m-1}) \frac{(0.50 - P_{m-1})}{(P_m - P_{m-1})} \text{ where } P_{m-1} \leq 0.50 < P_m \quad (11)$$

3.3 TRIANGULAR DISTRIBUTION

The triangular distribution is defined on the range (a,c) and has mode b. The mode can equal either of the two boundary values, which may simplify the computations (Iman and Shortencarier 1984). Use of the triangular distribution is appropriate when the range, (a,c), of the parameter is known and the analyst believes that his or her best estimate value, b, is also the mode (or most probable value) of the unknown distribution.

$$\begin{aligned} \text{Density Function: } f(x) &= \frac{2(x-a)}{(c-a)(b-a)} & a \leq x \leq b \\ &= \frac{2(c-x)}{(c-a)(c-b)} & b \leq x \leq c \end{aligned} \quad (12)$$

$$\begin{aligned} \text{Distribution Function: } F(x) &= \frac{(x-a)^2}{(c-a)(b-a)} & a \leq x \leq b \\ &= \frac{(b-a)}{(c-a)} - \frac{(x+b-2c)(x-b)}{(c-a)(c-b)} & b \leq x \leq c \end{aligned} \quad (13)$$

$$\text{Expected Value: } E(X) = \frac{a+b+c}{3} \quad (14)$$

$$\text{Variance: } V(X) = \frac{a(a-b)+b(b-c)+c(c-a)}{18} \quad (15)$$

$$\begin{aligned} \text{Median: } X_{0.5} &= a + \sqrt{\frac{(c-a)(b-a)}{2}} & \text{if } b \geq \frac{a+c}{2} \\ &= c - \sqrt{\frac{(c-b)(c-a)}{2}} & \text{if } b \leq \frac{a+c}{2} \end{aligned} \quad (16)$$

3.4 STUDENT'S-T DISTRIBUTION

A Student's-t distribution is a Bayesian distribution for the unknown mean value of a parameter (Tierney 1996). Its use is appropriate when one has measured values of the parameter available (in contrast to values obtained subjectively through elicitation of professional opinion). If N denotes the number of measurements available, and $X_1, X_2, X_3, \dots, X_N$ denote the values of the measurements, then the expected value or mean of the Student's-t distribution is the sample

mean. The standard deviation of the mean is the standard deviation divided by \sqrt{N} , which is also called the standard error. The median value is equal to the mean value.

The Student's-t distribution applies when there are few measurements, say $3 < N < 10$. For large N , say $N > 20$, there is little difference between the t-distribution and a normal distribution (see below) with the same mean and standard error.

In WIPP PA data characterized by Student's-t distribution are equally weighted. In other words, each measured value X_i is assigned a weight of $1/N$, where N is the number of measurements.

3.5 DELTA DISTRIBUTION

The delta distribution is used to assign probabilities to the elements of some set of objects (Martell 1996). For example, if the set consists of four alternative mathematical models of some phenomena and each model is labeled with one of the integers {1,2,3,4}, in other words,

$$M_1, M_2, M_3, M_4 \quad (17)$$

then we might assign the vector of probabilities (p_1, p_2, p_3, p_4) , where each p_i is a number between 0 and 1 and

$$p_1 + p_2 + p_3 + p_4 = 1. \quad (18)$$

The CDF associated with this delta distribution can be symbolically expressed by

$$F(x) = \sum_{n=1}^4 p_n u(x - n). \quad (19)$$

The graph of this CDF can be visualized as an ascending staircase starting at zero level for x less than one, and having steps of height p_n at the points $x = 1, 2, 3, 4$.

The notion of mean value and variance still apply to a delta distribution, but the meanings of these quantities may require careful interpretation. If the M_n represents four different functions (say, discharge as a function of pressure), then it makes sense to talk about mean and variance functions. For the example of the four alternative mathematical models, the mean mathematical model is the linear combination

$$\bar{M} = \sum_{n=1}^4 p_n M_n \quad (20)$$

and the variance of the models is similarly defined:

$$\Sigma^2 = \sum_{n=1}^4 p_n (\bar{M} - M_n)^2 \quad (21)$$

The notion of median value is meaningless for a delta distribution.

3.6 NORMAL DISTRIBUTION

Use of the normal distribution is appropriate when it is known that the parameter is the sum of independent, identically-distributed random variables (this is seldom the case in practice) and there are a sufficient number of measurements of the parameter ($N > 10$) to make accurate, unbiased estimates of the mean (μ) and variance (σ^2) (WIPP 1992, Tierney 1990).

Density function:
$$f(x) = \frac{1}{\sigma\sqrt{2\pi}} \exp\left\{-\frac{(x-\mu)^2}{2\sigma^2}\right\} \quad -\infty < x < \infty \quad (22)$$

Distribution function:
$$F(x) = \int_{-\infty}^x f(t) dt \quad -\infty < x < \infty \quad (23)$$

Expected value:
$$E(X) = \mu \quad (24)$$

Variance:
$$V(X) = \sigma^2 \quad (25)$$

The WIPP PA Program employs a truncated normal distribution where data are concentrated within an interval (lowrange, hirange) (Iman and Shortencarier 1984). The parameters of the truncated distribution can be expressed as follows:

$$E(X) = \mu = \frac{(lowrange + hirange)}{2} \quad (26)$$

$$V(X) = \sigma^2 = \left(\frac{hirange - lowrange}{6.18} \right)^2 \quad (27)$$

Median = mean (μ) and lowrange = 0.01 quantile, hirange = 0.99 quantile. The range of the random variable is arbitrarily set to (lowrange, hirange).

3.7 LOGUNIFORM DISTRIBUTION

Use of the loguniform distribution is appropriate when all that is known about a parameter is its range (a,b) and $B/A \gg 10$; that is, the range (a,b) spans many orders of magnitude. If X has a loguniform distribution on the interval from A to B where $B > A > 0$, then Y = $\log_{10} X$ has a uniform distribution from $\log_{10} A$ to $\log_{10} B$ (Iman and Shortencarier 1984).

Density Function:
$$f(x) = \frac{1}{x} (\ln B - \ln A) \quad A < x < B \quad (28)$$

Distribution Function: $F(x) = \frac{\ln x - \ln A}{\ln B - \ln A} \quad A < x < B$ (29)

Expected Value: $E(X) = \frac{B - A}{\ln B - \ln A}$ (30)

Variance: $V(X) = (B - A) \left[\frac{(\ln B - \ln A)(B + A) - 2(B - A)}{2(\ln B - \ln A)^2} \right]$ (31)

Median: $X_{0.5} = \sqrt{AB}$ (32)

3.8 LOGCUMULATIVE DISTRIBUTION

In this case, the independent variable is Y, where $Y = \log_{10} X$. As with the cumulative distribution, this distribution is described by a set of N ordered pairs (Martell 1996):

$$(y_1, 0), (y_2, P_2), (y_3, P_3), \dots, (y_N, 1) \{i.e., P_1 = 0 \text{ and } P_N = 1 \text{ always}\} \quad (33)$$

where $y_1 < y_2 < y_3 < \dots < y_N$ and $0 < P_2 < P_3 < \dots < P_{N-1} < 1$

Because of the nature of the data, the PDF for this distribution takes the form:

$$P(\xi) = \begin{cases} 0 & \text{if } \xi < x_1 \\ \frac{P_n - P_{n-1}}{\ln(x_n) - \ln(x_{n-1})} \frac{1}{\xi} & \text{if } x_{n-1} \leq \xi \leq x_n, n = 2, 3, \dots, N \\ 0 & \text{if } \xi \geq x_N \end{cases} \quad (34)$$

and so the CDF takes the form:

$$Pr[X \leq \xi] = \begin{cases} 0 & \text{if } \xi < x_1 \\ P_{n-1} + \frac{(P_n - P_{n-1})(\ln(\xi) - \ln(x_{n-1}))}{(\ln(x_n) - \ln(x_{n-1}))} & \text{if } \frac{x_{n-1} \leq \xi \leq x_n}{n = 2, 3, \dots, N} \\ 1 & \text{if } \xi > x_N \end{cases} \quad (35)$$

Expected Value: $E(X) = \sum_{n=2}^N (P_n - P_{n-1}) \frac{(x_n - x_{n-1})}{\ln(x_n) - \ln(x_{n-1})}$ (36)

Variance:
$$V(X) = \sum_{n=2}^N \frac{1}{2}(P_n - P_{n-1}) \frac{(x_n^2 - x_{n-1}^2)}{\ln(x_n) - \ln(x_{n-1})} - \{E(X)\}^2 \quad (37)$$

Median:
$$X_{0.5} = 10^{\left[\frac{x_{m-1} + (x_m - x_{m-1}) \frac{0.5 - P_{m-1}}{P_m - P_{m-1}}}{P_m - P_{m-1}} \right]} \quad \text{where } P_{m-1} \leq 0.5 \leq P_m \quad (38)$$

3.9 LOGNORMAL DISTRIBUTION

If $X \sim$ normal distribution with mean, μ , and variance, σ^2 , and $Y = e^X$, the Y has a lognormal distribution.

Density function:
$$f(y) = \frac{1}{y\sigma\sqrt{2\pi}} \exp\left\{-\frac{(\ln y - \mu)^2}{2\sigma^2}\right\} \quad y > 0 \quad (39)$$

Distribution function:
$$F(x) = \int_0^y f(t) dt \quad y > 0 \quad (40)$$

Expected value:
$$E(Y) = \exp\left(\mu + \frac{\sigma^2}{2}\right) \quad (41)$$

Variance:
$$V(Y) = \exp(2\mu + \sigma^2) [\exp(\sigma^2) - 1] \quad (42)$$

Median:
$$X_{0.5} = e^\mu \quad (43)$$

As with the truncated normal distribution, the truncated lognormal distribution requires lowrange and hirange values. These values are in logarithmic form and are utilized in a normal distribution to determine a mean (μ) and a variance (σ^2), which in turn are used to identify the expected value and variance for the lognormal distribution (Iman and Shortencarier 1984).

3.10 CONSTANTS

Parameters may also be assigned a constant value in the PA parameter database.

4.0 PARAMETER CORRELATION

Parameter correlations used in PA are exclusively in the code LHS. Consequently, parameter correlations affect only sampled parameters. Two types of parameter correlations are used. They are defined as explicit parameter correlation and induced parameter correlation. This section addresses the following criteria concerning parameter correlations, as specified in 40 CFR § 194.23(c)(6):

- (c) Documentation of all models and computer codes included, as part of any compliance application performance assessment calculation shall be provided. Such documentation shall include, but shall not be limited to:
 - (6) An explanation of the manner in which models and computer codes incorporate the effects of parameter correlation.

Explicit parameter correlations are introduced or prohibited in the LHS code by the restricted pairing technique of Iman and Conover (1982). Two parameter correlations are specified in this PA through this technique. These correlations are all related to rock compressibility and permeability. In the impure halite material region in BRAGFLO, rock compressibility (S_HALITE:COMP_RCK) and intrinsic permeability (S_HALITE:PRMX_LOG) are inverse correlated with a correlation coefficient of -0.99. In the Castile brine reservoir material region in BRAGFLO, rock compressibility (CASTILER:COMP_RCK) and intrinsic permeability (CASTILER:PRMX_LOG) are inverse correlated with a correlation coefficient of -0.75. Explicit parameter correlation is not used to correlate any other sampled parameters.

Rock compressibilities and intrinsic permeabilities are correlated to be most consistent with interpretations of the hydraulic tests that have been performed in these units. In hydraulic testing, hydraulic diffusivity (the ratio of permeability to compressibility) is determined more precisely than either permeability or compressibility alone. Introducing the correlation of the permeability and compressibility parameters in PA better represents the knowledge of the formation gained from hydraulic testing than specifying no correlation whatsoever.

An induced correlation in PA is created when a parameter sampled in the LHS code (the underlying variable) is used to define the values of other parameters (defined variables). This is a prevalent method of correlation in this PA. For example, uncertainty in dissolved actinide oxidation states is represented in the LHS code by sampling the OXSTAT parameter (GLOBAL:OXSTAT). The results of this sampling are used in part to determine actinide solubilities, colloidal actinide concentrations, and K_d values used for a particular vector. Selected examples of other induced parameter correlations include:

- the underlying variable x-direction permeability and the defined variables y- and z-direction permeabilities in many materials,
- the underlying variable x-direction permeability and defined variable threshold pressure in many materials,
- the underlying variable Lower Salado Clay permeability and the defined variable permeabilities of other clay members,

- the underlying variable residual gas saturation (or other two-phase flow parameters) in many materials and the defined variable residual gas saturation (or other two-phase flow parameters) in other materials.

There are four additional ways in which parameter correlations may be considered to be used in this PA, although they are not typically discussed as correlations per se. In a given LHS sample element, there is a correlation of 1 (100 percent) between the single observation of subjective uncertainty (the LHS sample for a complementary cumulative distribution function (CCDF)) with all of the sequences of random future events (scenarios) used to construct a CCDF.

A correlation is made between the scenario being considered and the chemical properties (chemical composition) of brine in the repository (the physical properties viscosity and density are assumed to be the same for all scenarios). Brine composition affects actinide solubility. For undisturbed performance and E2 scenarios, brine composition is considered to be that of Salado brine. For the E1 and E2 scenarios, the brine composition is considered to be that of Castile brine.

There are some correlations made in the construction of a CCDF regarding the similarity of events in a sequence of random future events. For example, the direct releases resulting from a third or later intrusion are determined from the calculated conditions following the second intrusion.

Finally, there are also correlations among model parameters developed explicitly by the governing equations of computational models used. For example, the porosity of nodal blocks in BRAGFLO is a function of the initial porosity, pressure change, and compressibility.

5.0 PABC-2009 PARAMETER VALUES

A number of parameters were updated or added since the CRA-2009 PA (Section 5.1). The parameter values for the sampled parameters (Section 5.2) and constant parameters (Section 5.3) are also discussed in this section.

5.1 CHANGES TO PARAMETERS BETWEEN THE CRA-2009 PA AND THE PABC-2009

Nineteen parameters have been added since the CRA-2009 PA and are listed in Table 1. These parameters have been added to remove the numerical values that were typed in the PA input files (Clayton 2009a, Clayton 2009b, and Nemer 2009). For the PABC-2009, 130 parameters were modified from the values used in the CRA-2009 PA and are shown in Table 2. The majority of the parameters were modified to include the updated information in the PA inventory report (Fox, Clayton and Kirchner 2009, Brush, Xiong and Long 2009 and Xiong et al. 2009), drilling report (Clayton 2009a) and groundwater data (Beauheim 2009). Seventeen parameters were modified to remove the numerical values that were typed in the PA input files (Nemer 2009). Seven parameters were modified in response to an EPA completeness comment (Clayton 2009c).

Table 1. Parameters Added for the PABC-2009

The tables identify the Material Name, Property Name, Code(s) that utilize the parameter and distribution type. Details and justification of parameter changes are documented the individual parameter's data entry form and supporting justification document(s). The references for the

supporting justification documents for the new and updated parameters are shown in Table 1 and Table 2

5.2 SAMPLED PARAMETERS

The parameters sampled by the LHS code are listed in Table 3. The table identifies the parameter number (the number represents the sample order), the Material Name, the Property Name and the code that utilizes the parameter. Parameter sampling order has not changed since the CRA-2009 PA.

6.0 EPAUNI INPUT DATA

The WIPP repository radionuclide inventory build-up and decay is determined by a computational method found in the code: EPAUNI Version 1.15A. Inventory data, provided by Los Alamos National Laboratory (LANL), is formatted for use by the code and input for use in the PA. Table 39 and Table 40 represent input files used for the code EPAUNI Version 1.15A. Table 39 contains radionuclide inventory data from the EPAUNI CH input file EPU_PABC09_CH.INP found in the library LIBPABC09_EPU. Table 40 contains radionuclide inventory data from the EPAUNI RH input file EPU_PABC09_RH.INP found in the library LIBPABC09_EPU. The development of the EPAUNI input files from the inventory is documented in Fox, Clayton and Kirchner (2009).
