#### 1 1.0 INTRODUCTION

#### 2 1.1 Background

- 3 The U.S. Department of Energy's (DOE's) Waste Isolation Pilot Plant (WIPP) opened on March
- 4 26, 1999, becoming the nation's first deep geologic repository for the permanent disposal of
- 5 defense-generated transuranic (TRU) waste. At the time of data cut off for the Compliance
- 6 Recertification Application 2004 (CRA-2004) (September 30, 2002), the waste was in
- 7 retrievable storage at 27 sites across the country (see Figure 1), pending disposal at the WIPP.
- 8 From the WIPP's opening through the inventory cut off date (September 30, 2002), 1,255
- 9 shipments of TRU waste were safely characterized, transported, and disposed in the WIPP.
- 10 TRU waste is defined as "...waste containing more than 100 nanocuries of alpha-emitting
- transuranic isotopes per gram of waste, with half-lives greater than 20 years..." (Public Law No.
- 12 102-579, 110 Stat. 2422 [1992], as amended by 104-201 [1996]) (U.S. Congress 1996). TRU
- wastes are classified as either contact-handled (CH) or remote-handled (RH), depending on the
- dose rate at the surface of the waste container. CH-TRU wastes are packaged TRU wastes with
- an external surface dose rate less than 200 millirem (mrem) per hour, while RH-TRU wastes are
- packaged TRU wastes with an external surface dose rate of 200 mrem or greater per hour (U.S.
- 17 Congress 1996). Unless otherwise indicated, for the purpose of this document, all references to
- 18 TRU waste include TRU waste and mixed TRU waste (waste that contains both radioactive and
- hazardous components, as defined by the Atomic Energy Act [U.S. Congress 1954] and the
- 20 Resource Conservation and Recovery Act [RCRA] as codified in Title 40 Code of Federal
- 21 Regulations [CFR] Part 261.3 [EPA 1980]).
- The DOE is committed to demonstrating compliance with all applicable regulations for the
- 23 permanent disposal of TRU defense wastes in the WIPP repository. These regulations are the
- 24 environmental standards for management and disposal of TRU defense wastes as mandated in 40
- 25 CFR Part 191 (EPA 1993) and Part 194 (EPA 1996), and the RCRA regulations. Compliance
- demonstration through performance assessment (PA) calculations for the CRA-2004 (DOE
- 27 2004c) is based on the estimated inventory of existing and currently projected waste streams
- 28 compiled in this document.
- 29 The purpose of the WIPP TRU Waste Baseline Inventory Report (WTWBIR) Revision 0 (DOE
- 30 1994) and Revision 1 (DOE 1995a) was to provide data to be included in the PA modeling
- 31 calculations for the WIPP. The *Transuranic Waste Baseline Inventory Report*, Revision 2
- 32 (hereafter referred to as TWBIR Revision 2) (DOE 1995b) expanded the original purpose of
- Revisions 0 and 1 to include support for the WIPP Land Withdrawal Act (LWA) (U.S. Congress
- 34 1996) by providing an estimate of the total DOE TRU waste inventory. The TWBIR Revision 2
- included a chapter and an appendix that discussed the total estimated DOE TRU waste inventory,
- including non-defense, commercial, polychlorinated biphenyl (PCB)-contaminated, and buried
- 37 (predominately pre-1970) TRU wastes that were not planned at the time for disposal in WIPP.
- 38 Since that time, Idaho National Engineering and Environmental Laboratory (INEEL), now the
- 39 Idaho National Laboratory (INL), is preparing to ship pre-1970 buried waste to WIPP.

Ovals and circles represent large quantity sites; squares represent small quantity sites; WIPP is shown in blue.

Figure 1. U.S. Department of Energy TRU Waste Sites

The *Transuranic Waste Baseline Inventory Report*, Revision 3 (hereafter referred to as TWBIR Revision 3) (DOE 1996a) was based on the TWBIR Revision 2 (DOE 1995b) data, which were supplemented by data in several memoranda issued during early calendar year (CY) 1996. These memoranda summarize additional data requested by the DOE to support PA modeling calculations.

The primary purpose of TWBIR Revision 3 (DOE 1996a) was to provide the summary data from TWBIR Revision 2 (DOE 1995b) and the supplemental information used in the PA for the development of the Compliance Certification Application (CCA) (DOE 1996b) that was delivered to the Environmental Protection Agency (EPA), to comply with the LWA (U.S. Congress 1996). The supplemental information was generated from specific data requests to the TRU waste sites since the publication of the TWBIR Revision 2. These supplemental data included estimates for complexing agents, oxyanions, and cement content in solidified waste that were first included in the 2003 Update Report, Appendix DATA Attachment F of the *Compliance Recertification Application 2004* (DOE 2004c).

The purpose of this *Transuranic Waste Baseline Inventory Report - 2004*, for the 2004 WIPP Compliance Recertification Application (hereafter referred to as the TWBIR - 2004) is to document the total estimated inventory of DOE TRU waste as defined by the DOE TRU waste sites. This document is a revision of Attachment F found in the Appendix DATA of the CRA-2004 (DOE 2004c). The primary purpose of this document is to provide the summary data required for the PA modeling calculations in support of the CRA-2004 that were used in the Performance Assessment Baseline Calculation (PABC) (Leigh et al. 2005a; Leigh et al. 2005b). Knowing that the WIPP waste inventory information has changed as a result of characterization activities, improved estimation processes, and emplacement of waste in WIPP, the EPA requested that an update to the CCA (DOE 1996b) inventory be included in the CRA-2004. This information was subsequently updated at EPA's request (Cotsworth 2005). TWBIR - 2004 provides the changes that were made to the inventory estimate that was submitted as part of the PABC.

#### 1.2 Purpose and Objectives

The TWBIR Revision 2 (DOE 1995b) contained the TRU Waste Baseline Inventory Waste Profiles (waste profiles) for all waste stream identifications (ID) (referred to waste stream in this report) reported by the TRU waste sites at that time, including some TRU waste streams that were unacceptable for disposal at WIPP. The waste profiles resided in two appendices in TWBIR Revision 2 (DOE 1995b). Appendix O reported the "Non-WIPP" waste streams and Appendix P reported the "WIPP" waste streams. For the TWBIR - 2004, Appendix I reports the "non-WIPP" waste streams, Appendix J reports the "WIPP" waste streams, and Appendix K reports the "emplaced waste." Although all TRU waste streams currently reported by the sites are accounted for in the current database (TWBID Revision 2.1, see Section 2.1.3) and are reported in the TWBIR - 2004, the non-WIPP waste streams do not contribute to the volume and scaling calculations. Hence, the non-WIPP waste streams did not contribute to the estimated TRU waste inventory for the PABC (Leigh et al. 2005a; Leigh et al. 2005b).

The objectives of the TWBIR - 2004 are to:

- 1. Estimate and describe the DOE TRU waste inventory;
- 2. Provide the required CRA information (Appendix DATA Attachment F and specific information requested by the EPA [Cotsworth 2005]) that were used to support the March 2006 WIPP recertification in a stand alone document; and
- 3. Provide updated information used in the PABC inventory.

To effectively keep track of the changes in the TRU waste inventory, site TRU waste inventory information will be monitored for changes as an ongoing process and will be reflected in subsequent issues of this document.

#### 1.3 Sources of Transuranic Waste Information

For this revision, the TRU waste inventory estimate was developed using existing information about the waste, which was provided by the TRU waste sites. In addition, information obtained from site Acceptable Knowledge (AK) Summary Reports was incorporated to provide the most current information on waste streams being characterized and shipped to WIPP. Particular focus on data collection involved discussion with TRU waste sites about changes to the inventory since the certification of WIPP in 1998. Site visits and onsite interviews facilitated data collection and ensured data were accurately represented.

This report includes information taken from the TWBIR Revisions 2 and 3, the WIPP Waste Information System (WWIS), and information provided by the TRU waste sites. The information found in the TWBIR Revision 2 (DOE 1995b) has not been updated since the publication of that document. The TWBIR Revision 3 (DOE 1996a) used the same data plus other supplemental data that were needed for the CCA PA calculations. The WIPP has been open and receiving waste since March 1999. Therefore, data from the emplaced waste through September 30, 2002, as obtained from the WWIS are included in this report.

#### 1.4 Document Organization

TWBIR - 2004 is organized to be consistent with the TWBIR Revision 3 (DOE 1996a). The contents of remaining sections in this document are summarized below.

- Section 2.0 presents the approach and methods used for gathering and compiling the WIPP waste disposal estimated inventory information, including data entry into the *Transuranic Waste Baseline Inventory Database Revision 2.1, Version 3.13, Data Version D.4.16* (LANL 2005) (hereafter referred to as TWBID Revision 2.1) and a description of the records system used to document the data, as well as analysis methods and results.
- Section 3.0 presents summaries of inventory information including the waste volumes, waste material parameters (WMPs), packaging materials, chemical components, radiological components, discussion regarding the non-WIPP and future potential TRU waste, and discussion regarding the materials used to emplace the waste in the WIPP.

#### 2.0 METHODS AND APPROACH

This document provides the information that was first reported as part of the WIPP CRA-2004 (DOE 2004c) and includes, as requested by the EPA, selected 2004 updates (Cotsworth 2005). The work was performed by Los Alamos National Laboratory – Carlsbad Operations (LANL-CO) and Sandia National Laboratories (SNL). The role of LANL-CO was to provide the updated inventory estimate and associated analyses using inventory information to support the PABC (Leigh et al. 2005a; Leigh et al. 2005b). The role of SNL was to perform the PA calculations, and provide documented results for the PABC. The technical work performed and documentation produced was governed by the SNL WIPP Quality Assurance (QA) Program developed for the SNL Nuclear Waste Management Program (NWMP). Under the SNL QA Program, LANL-CO Inventory personnel:

- 1. Collected TRU waste stream information from the TRU waste sites via site visits and additional communication, as needed;
- 2. Entered the information into the Transuranic Waste Baseline Inventory Database (TWBID) Revision 2.1 (LANL 2005), a quality assured electronic database;
- 3. Performed analyses of the information in support of the CRA-2004 (DOE 2004c) PA and PABC; and
- 4. Submitted the above results as official WIPP records acceptable for use in WIPP PA calculations.

The following sections describe the four basic process steps leading to the issuance of this report. Section 2.1 discusses information collection, compilation, verification, and validation. Section 2.2 explains the analyses that were performed to provide the information needed to support the PABC calculations (DOE 2004c; Leigh et al. 2005a; Leigh et al. 2005b). An extensive discussion on the evolution of the TWBID, a detailed discussion of the analyses and topics required supporting the PA, and listings of the supporting documents in the SNL WIPP Records Center are given in Appendix M.

#### 2.1 Collection, Compilation, Verification, and Validation of Inventory Information

The sections that follow describe the process of information collection, entry, verification, and validation used to ensure quality was maintained throughout the TRU waste inventory process. The information provided in Section 2.1.1 was specifically called out by SNL to address the PA information needs (Giambalvo 2002). The information was then collected from the TRU waste sites, entered into the TWBID Revision 2.1 (LANL 2005), and independently reviewed and verified by inventory personnel and validated by the sites. The process, by which information was collected, entered, reviewed, verified, and validated is described in Sections 2.1.2 through 2.1.4.

All of the activities described in this section were governed by SNL Procedure SP 9-6, *Baseline Inventory Report (BIR) Change Report Data Collection and Entry* (SNL 2003b). A collection of the documents compiled for each site is provided in Appendix M, including their respective Electronic Records Management System number (ERMS #).

#### 2.1.1 Information Requested for the Performance Assessment

The information requested for the TWBIR - 2004 were called out in a series of communications shown in Appendices G and H. The specific information needs for PA were given in Giambalvo (2002) and include the following:

- Waste stream volumes, broken down into categories of stored, projected, and anticipated waste (sum of stored and projected);
- Inventory of radionuclides by waste stream for both CH- and RH-TRU waste with the requirement that the radionuclides reported be decayed to a common base year;
- Inventory of all non-radioactive waste material parameters that were previously tracked in the TWBIR Revision 3 (DOE 1996a). In addition, identification of all waste streams containing pyrochemical salts;
- Inventory of any other non-radioactive waste materials that are discovered to account for a significant portion of a waste stream as a result of changes to the inventory;
- Inventory of cellulosics, plastics, and rubber (CPR) and other biodegradable materials used to facilitate emplacement of waste and magnesium oxide (MgO) in the WIPP;
- Inventory of organic complexing agents and oxyanions (sulfate, nitrate, and phosphate); and
- Waste-stream level inventories of radionuclides and non-radioactive waste material parameters for waste currently emplaced in the WIPP.

#### 2.1.2 Collection Method

For purposes of recertification, the EPA was primarily concerned with changes in the TRU waste inventory since the initial WIPP CCA (DOE 1996b) and certification. Each TRU waste site was sent a copy of their inventory information originally submitted in 1995 for the CCA, in the form of waste profiles from the TWBIR Revision (DOE 1995b). Guidance was included describing the information that each site needed to provide for the PA.

The sites were requested to indicate changes on the waste profiles, including any necessary explanation. The information from the updated waste profiles was entered into the TWBID Revision 2.1 (LANL 2005), independently verified, and were qualified under SNL NP 19-1, *Software Requirements* (SNL 2004). Upon completion, each site's update waste profile was returned to the appropriate DOE site representative for verification and signature.

Figure 2 illustrates the steps involved in data collection, processing, and reporting.

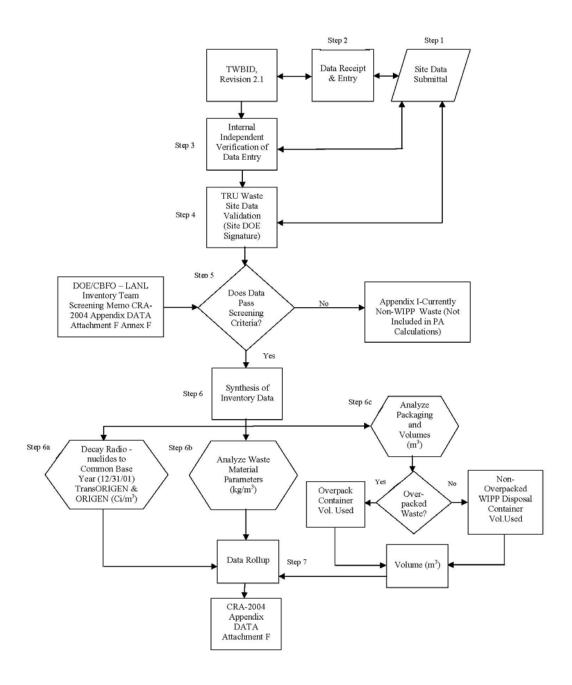

Figure 2. TRU Waste Inventory Process Flow Chart

The methodology used to collect information from the TRU waste sites and to enter this information into the TWBID Revision 2.1 (LANL 2005) is captured in procedure SP-9-6, *Baseline Inventory Report (BIR) Change Report Data Collection and Entry* (SNL 2003b). The process described in this procedure was initiated by a data call based on a request for updating the waste profile information that was included in the TWBIR Revision 2 (DOE 1995b). A second data call specifically requested information required by SNL (Giambalvo 2002). During this time, LANL-CO visited sites to facilitate collection of inventory information, and assist with questions and issues.

As a result of EPA's Completeness Review in 2003, the information from two large quantity sites was subsequently updated with new information and processing. This occurred during the review of the inventory information that was submitted as Attachment F to Appendix DATA of the CRA-2004 (DOE 2004c). An email from Hanford Richland Operations Office (Hanford RL) identified several waste profiles and associated waste streams that they failed to delete when this information was initially submitted. An analysis was performed (Lott 2004a) for these waste profiles, which were subsequently deleted, and therefore supporting the basis for this report.

In addition to the changes in the Hanford information, INL began processing pre-1970 buried waste for shipment to WIPP. Inventory information was collected from the site to update waste stream information on the IN-Z001 buried waste that had been included in the inventory update for the CRA-2004 as possible future waste but "non-WIPP shippable." The site responded to an email request for direction on how the waste stream would be reported in final form. Subsequent discussion and email exchanges resulted in the determination of the IN-Z001 to be separated into five waste streams by expected content based on AK documentation being collected at the site (Lott 2004b).

#### 2.1.3 Implementation of the Transuranic Waste Baseline Inventory Database, Revision 2.1

Inventory information collected from the sites included electronic media containing inventory information, notes from discussions with site waste management personnel, email correspondence, and site literature. The collected inventory information was then compiled and used to update the TWBID Revision 2.1 (LANL 2005) by deletion of waste profiles and associated waste streams that were no longer maintained and/or assimilated into other waste profiles, modification of waste streams, and addition of new waste streams. This information was submitted to the SNL WIPP Records Center.

Waste stream profile information was modified for sites that either had additional information or had modified TWBIR Revision 2 (DOE 1995b) waste streams. When discrepancies were found or sites requested changes to inventory information after preliminary inventory information was entered into the database, change information was documented on forms found in Procedure SP-9-6, *Baseline Inventory Report (BIR) Change Report Data Collection and Entry* (SNL 2003b). The inventory information in the database was updated to reflect this new information and the documentation supporting the changes was submitted to the SNL Records Center.

#### 2.1.4 Inventory Information Verification and Validation

After inventory information was entered and/or updated into the TWBID, an independent review was conducted of all changes that were made to the database. This review was tracked and documented in the database. When all changes were completed, the database record (waste profiles) were sent back to the sites for final verification and validation, and authentication by the DOE site representative. Documentation of validation was submitted to the SNL WIPP Records Center.

Additional records were collected from sites after the inventory was validated and authenticated by DOE site representatives. Records were received from each site explaining changes that had occurred with their inventory since the baseline data collection was performed in 1995. These records were also entered into the SNL WIPP Records Center and excerpts from these records are provided in Appendix C to this report.

#### 2.2 Analysis Methods

In addition to collecting and processing information from the TRU waste sites and securing the site information in a qualified database for future use, analyses were performed on the information to support the CRA-2004 (DOE 2004c) PA and PABC (Leigh et al. 2005a; Leigh et al. 2005b). For example, volume data from waste streams were rolled up into stored, projected, and anticipated categories; WMPs were rolled up to provide average waste material densities in the repository; radionuclides were decay-corrected to the end of calendar year 2001; and radionuclide activities were scaled for the full repository. Appendix M provides a detailed listing of all of the analyses that were required to produce the report that was submitted to EPA as Attachment F to Appendix DATA of the CRA-2004 (DOE 2004c), as well as the reports that supported the PABC.

The analyses were performed in accordance with AP-092, *Analysis Plan for the Transuranic Waste Inventory Update Report*, 2003 (SNL 2003a), and two additional analysis plans: AP-112 *Analysis Plan for CRA Response Activities* (SNL 2005a), and AP-113 *Analysis Plan for Inventory Reconciliation: Compliance Recertification Application* (SNL 2005b). AP-112 was written to respond to EPA questions during the CRA-2004 Completeness Review. AP-113 was written to address internal review comments on the document but that have had no impact on PA calculation (Crawford and Leigh 2004). AP-113 was updated as necessary as the information in TWBID Revision 2.1 (LANL 2005) was updated. Section 3.2.3, Chemical Components in Transuranic Waste, including cement analysis and revisions to oxyanions and complexing agents, and Section 3.5, Emplacement Materials, have been revised as needed according to AP-113.

#### 2.2.1 Radionuclide Decay Calculations

One of the needs for the radionuclide inventory information (see Section 2.1.1) for the PA is that all radionuclides reported by waste stream in TWBID Revision 2.1 (LANL 2005) be decayed to a common time frame. However, the site data provided consisted of radionuclide activity concentrations at the date of assay (if the waste stream was assayed) or at the date that the site calculated the activity concentrations. In order to make the radionuclide information complete,

the radionuclide activity concentration reported by the sites was exported from the TWBID Revision 2.1 into an external application (ORIGEN, ORNL 2002) where the radionuclide decay calculations were performed, and then imported back into the TWBID Revision 2.1. See Appendix M for more discussion concerning radionuclide decay calculation and reporting.

#### 2.2.2 Roll-up and Scaling Calculations

The roll-up and scaling calculations performed in support of this report were performed in the TWBID Revision 2.1 (LANL 2005). The computational methods that apply to the roll-up and scaling calculations were defined in the Computational Methodology (LANL 2003). This methodology document was used as the basis for drafting the design documentation required for software qualification of TWBID Revision 2.1. The queries that have been qualified for use in TWBID Revision 2.1 produce the data that are tabulated throughout this report and are documented in records submitted to the SNL WIPP Records Center.

#### **2.2.3** Chemical Component Calculations

A final request for information set forth in Giambalvo (2002) was that this report supply information about the chemical components of the waste such as that supplied in support of the CCA PA in the TWBIR Revision 3 (DOE 1996a). This included a calculation of the mass of organic ligands (complexing agents), the mass of oxyanions (nitrate, sulfate, and phosphate), and the mass of cement expected in the disposal volume for WIPP including the breakout of these components by waste stream.

The calculation of the estimated mass of organic ligands, oxyanions, and cement in the disposal volume for WIPP was governed by SNL Procedure NP 9-1, *Analyses* (SNL 2001). The reports are discussed in Sections 3.2.3.1, 3.2.3.2, and 3.2.3.3. Appendix A contains the results of an analysis of the inventory for pyrochemical salts. The waste streams containing the specific chemical components can be found in Appendix L.

#### 2.3 Records

The entire process of data collection, database development, and analysis leading up to the publication of this report has been documented and submitted to the SNL WIPP Records Center in accordance with SNL Procedure NP 17-1, *Records* (SNL 2003c). A detailed discussion of the records that have been used to generate this report can be found in Appendix M.

#### 3.0 TRANSURANIC WASTE INVENTORY ESTIMATES

This section presents the estimated TRU waste inventory that was collected on behalf of the DOE in support of CRA-2004 (2004c) and was subsequently updated for the PABC (Leigh et al. 2005a; Leigh et al. 2005b). The inventory information is stored in an electronic database, the TWBID Revision 2.1, Version 3.13, Data Version D.4.16 (LANL 2005), which has been qualified as discussed generally in Section 2 and in detail in Appendix M of this report.

This presentation of the TRU waste inventory consists of summaries of the inventory information collected from the TRU waste sites and the information calculated from the data submitted by the sites. Section 3.1 presents the volume information provided by the sites for

CH- and RH-TRU waste and the volume roll-ups to the WIPP repository capacity needed for PA. Section 3.2 presents the non-radiological waste inventory as reported by the sites and as needed for PA. This includes roll-ups of the waste materials (Section 3.2.1), roll-ups of the packaging materials (Section 3.2.2), and information about the chemical components of the waste (Section 3.2.3). Section 3.3 presents the radionuclide inventory reported by the sites and WIPP-level roll-ups of the radionuclide data needed for PA.

Section 3.4 presents a discussion of the non-WIPP and future potential waste, and provides the total volumes of the non-WIPP wastes. Section 3.10 provides information for the materials used to facilitate waste emplacement at the WIPP. The complete TRU waste inventory for all waste streams at all of the sites has been prepared in support of the CRA-2004 (DOE 2004c) and the PABC (Leigh et al. 2005a; Leigh et al. 2005b). That inventory is presented by site by waste stream in Appendices I, J, and K. Appendix I presents individual waste stream profiles for all of the waste streams that have been designated as non-WIPP waste streams, as discussed in Section 3.7. Appendix J presents individual waste stream profiles for all WIPP waste streams planned for emplacement in the WIPP. Appendix K presents individual waste stream profiles for all WIPP waste streams that were emplaced in the WIPP as of September 30, 2002.

#### 3.1 Transuranic Waste Volume Inventory Estimates

The volume information requested from the sites was broken down as follows:

- stored waste waste that currently exists at the TRU waste site, regardless of whether it is in its final form,
- projected waste waste that will be generated in the future, and
- anticipated waste stored plus projected.

Information for emplaced wastes was obtained from the WWIS. The total waste stream volume collected from the sites included stored  $(v_s)$  and projected  $(v_p)$  components as applicable for each TRU waste stream. The sites also reported both "As Generated" and "Final Form" (as opposed to "Final Waste Form") waste volumes for their waste streams (see Glossary for definitions). The "Final Form" volume accounts for the payload container (the volume the waste container occupies in the repository). Since PA only considers the waste volume that will be disposed in the WIPP, only the "Final Form" volumes were used of actual (reported by the site) and scaled (used in PA) waste volumes.

Table 1 presents the CH-TRU waste anticipated inventory volumes reported by the sites. Table 2 presents the RH-TRU waste anticipated inventory volume reported by the sites. The data presented in Tables 1 and 2 were derived by summing the waste-stream-level data into a site-level roll-up. For each site, all stored waste stream volumes  $(v_s)$  were summed to arrive at the total stored volume for the site,  $V_s$ . All projected waste stream volumes  $(v_p)$  were summed to arrive at the total projected volume for the site,  $V_p$ . The sum of the total stored volume and the total projected volume is the anticipated volume,  $V_a$ .

$$V_n = V_s + V_n \tag{1}$$

#### Where

 $V_a$  is the total anticipated volume

 $V_s$  is the total stored volume

 $V_p$  is the total projected volume.

Table 1. WIPP CH-TRU Waste Anticipated Inventory By Site

| TRU Waste Site  | Stored<br>Volumes<br>(Cubic<br>Meters) | Projected<br>Volumes<br>(Cubic<br>Meters) | Anticipated<br>Volumes<br>(Cubic<br>Meters) |
|---|--|---|---|
| Argonne National Laboratory - East                        | 1.1E+02                                | 8.0E+01                                   | 1.9E+02                                     |

## 3.1.1 Waste Isolation Pilot Plant-Level Roll-Up of Waste Inventory for Performance Assessment

The PA conducted in support of the WIPP recertification was predicated on the assumption that the WIPP repository will be filled to its design capacity at the time of closure. The design capacity for WIPP is 175,564 m³ (6,200,000 ft³) (U.S. Congress 1996) with a limit of 7,079 m³ (250,000 ft³) for RH-TRU waste as imposed by the Consultation and Cooperation Agreement (C&C Agreement) (DOE and State of New Mexico 1988), therefore the CH-TRU disposal limit is 168,485 m³ (5,950,000 ft³). The volume of anticipated plus emplaced waste (CH-TRU and RH-TRU) reported by the sites in support of the CRA-2004 (DOE 2004c) and the PABC (Leigh et al. 2005a; Leigh et al. 2005b) is less than the design capacity for the WIPP for CH-TRU waste, but more than the WIPP design capacity for RH-TRU waste. Therefore, scaling the CH-and RH-TRU waste in the WIPP is necessary for PA. The scaled inventory for PA is referred to as the disposal volume as described in the Glossary. The CH-TRU waste was scaled up since the anticipated volume is less than the allowable capacity. The RH-TRU waste was scaled down because the anticipated volume of RH-TRU waste exceeded the allowable limit. Scaling is performed only on projected waste.

Table 3 presents the volume scaling factors. The following sections discuss the calculation of the WIPP-level roll-up for CH- and RH-TRU waste.

**Table 3. Volume Scaling Factors** 

| CH WASTE                         |                         |  |  |  |  |
|----------------------------------|-------------------------|--|--|--|--|
| WIPP capacity for waste          | $1.68E+05 \text{ m}^3$  |  |  |  |  |
| Total stored volume              | 1.09E+05 m <sup>3</sup> |  |  |  |  |
| Total projected volume           | 3.47E+04 m <sup>3</sup> |  |  |  |  |
| Total emplaced volume            | 7.72E+03 m <sup>3</sup> |  |  |  |  |
| Volume scaling factor (SF CH )   | 1.48E+00                |  |  |  |  |
| Note: 1.68E+05 - (1.09E+05 + 7.7 | 2E+03) = 1.48E+00       |  |  |  |  |

Note:  $\frac{1.68E+05 - (1.09E+05 + 7.72E+03)}{(3.47E+04)} = 1.48E+00$ 

| RH WASTE   |                         |  |  |  |
|--|-------------------------|--|--|--|
| WIPP capacity for waste  | 7.08E+03 m <sup>3</sup> |  |  |  |
| Total stored volume  | 5.29E+03 m <sup>3</sup> |  |  |  |
| Total projected volume   | 2.08E+03 m <sup>3</sup> |  |  |  |
| Total emplaced volume  | $0.00E+00 \text{ m}^3$  |  |  |  |
| Volume scaling factor (SF RH)  | 8.61E-01                |  |  |  |
| Note: $\frac{7.08E+03 - (5.29E+03 + 0.00E+00)}{(2.08E+03)} = 8.61E-01$ |                         |  |  |  |

# 3.1.1.1 Calculation of Waste Isolation Pilot Plant-Level Roll-Up for Contact-Handled Transuranic Waste

The WIPP disposal limit for CH-TRU waste is 168,485 m<sup>3</sup> (5,950,000 ft<sup>3</sup>). Since the total reported volume of CH-TRU waste is less than the WIPP limit, the projected volume was scaled so the total volume equaled the CH-TRU waste disposal limit for WIPP. The scaling factor for CH-TRU waste was calculated using the following equation applied to WIPP waste streams.

The CH-TRU waste volume scaling factor was calculated as follows:

$$SF_{CH} = (CH-TRU Design Capacity Volume in m^3 - V_s - V_e)/V_p$$
 (2)

#### Where

 $SF_{CH}$  is the scaling factor for the CH-TRU waste volume as of September 30, 2002  $V_s$  is the total stored volume over all waste streams and all sites for CH-TRU waste  $V_e$  is the total emplaced volume over all waste streams and all sites for CH-TRU waste

 $V_p$  is the total projected volume over all waste streams and all sites for CH-TRU waste

The disposal inventory for a single CH-TRU waste stream was obtained by multiplying the CH-TRU waste projected volume by the appropriate scaling factor and adding that value to the stored and emplaced volumes for each waste stream.

$$V_{CH-Disposal} = SF_{CH}(v_p) + v_s + v_e$$
(3)

Where

 $v_{CH\text{-}Disposal}$  is the disposal volume for CH-TRU waste for a single waste stream is the scaling factor for the CH-TRU waste volume  $v_p$  is the projected inventory volume for a single CH-TRU waste stream before scaling is the stored inventory volume for a single CH-TRU waste stream  $v_e$  is the emplaced inventory volume for a CH-TRU single waste stream

The total CH-TRU waste disposal inventory,  $V_{\text{CH-Disposal}}$ , is the sum of the scaled CH-TRU waste stream volumes. The scaled waste stream volumes for the CH-TRU waste streams included in the estimate of volume for the PABC are given in Appendix E, Table E-1. All volume and scaling calculated results were derived from the information that was reported in the updated TWBID Revision 2.1 (LANL 2005) for each CH-TRU waste stream. The volume rollups and scaling calculations were performed under the SNL QA program as described in the Computational Methodology (LANL 2003).

## 3.1.2 Calculation of Waste Isolation Pilot Plant-Level Roll-up for Remote-Handled TransuranicWaste

The WIPP disposal limit for RH-TRU waste is 7,079 m³ (250,000 ft³) (U.S. DOE and State of New Mexico 1988). The reported volume of stored RH-TRU waste is less than the disposal limit but the sum of the stored and projected volumes is greater than the disposal limit. Since the total reported volume of RH-TRU waste is greater than the WIPP limit, the projected volume was scaled down so the total volume for PA equaled the RH-TRU waste disposal limit for WIPP. The scaling factor for RH-TRU waste was obtained after RH-TRU waste streams designated as non-WIPP waste streams (Appendix I) were removed for WIPP waste streams.

The scaling factor for RH-TRU waste was calculated using the following equation:

$$SF_{RH} = (RH-TRU Design Capacity Volume in m^3 - V_s - V_e)/V_p$$
 (4)

Where

| $SF_{RH}$ | is the scaling factor for the RH-TRU waste volume as of September 30, 2002      |
|-----------|---|
| $V_s$     | is the total stored volume over all waste streams and all sites for RH-TRU      |
|           | waste   |
| $V_e$     | is the total emplaced volume over all waste streams and all sites for RH-TRU    |
|           | waste   |
| $V_{p}$   | is the total projected volume over all waste streams and all sites for RH waste |

There is currently no RH-TRU waste emplaced in the WIPP, so the total RH-TRU waste emplaced volume,  $V_e$ , is zero.

The disposal inventory for a single RH-TRU waste stream was then obtained by multiplying the RH-TRU waste projected volume by the appropriate scaling factor and adding that value to the stored and emplaced volumes for each waste stream.

$$v_{RH-Disposal} = SF_{RH}(v_p) + v_s + v_e \tag{5}$$

Where

| V <sub>R</sub> H-Disposal | is the disposal volume for RH-TRU waste for a single waste stream         |
|---------------------------|---|
| $SF_{RH}$                 | is the scaling factor for the RH-TRU waste volume                         |
| $V_{S}$                   | is the stored inventory volume for a single RH-TRU waste stream           |
| $v_e$                     | is the emplaced inventory volume for a single RH-TRU waste stream         |
| $V_p$                     | is the projected inventory volume for a single RH-TRU waste stream before |
| •                         | scaling   |

Table 3 shows the calculation for the RH-TRU waste scaling factor and the RH-TRU waste volumes. The total RH-TRU waste disposal inventory, V<sub>RH-Disposal</sub>, is the sum of the scaled RH-TRU waste stream inventories. The scaled waste stream volumes for the RH-TRU waste streams included in the estimate of volume for the PABC is given in Appendix E, Table E-2. All volume and scaling calculated results were derived from the information that was reported in the updated TWBID Revision 2.1 (LANL 2005) for each RH-TRU waste stream. The volume rollups and scaling calculations were performed under the SNL QA program as described in the Computational Methodology (LANL 2003).

The total disposal inventory for the WIPP repository is the sum of the disposal volumes for CH- and RH-TRU wastes for all waste streams after scaling ( $V_{\text{CH-Disposal}}$ ).

#### 3.2 Non-Radiological Aspects of the Transuranic Waste Inventory Estimate

This section presents the non-radiological aspects of the TRU waste inventory that was collected on behalf of the DOE in support of the CRA-2004 (DOE 2004c) and the PABC (Leigh et al. 2005a; Leigh et al. 2005b). Section 3.2.1 presents the estimated inventory of waste materials. Section 3.2.2 presents the estimated inventory of packaging materials, and Section 3.2.3 presents the estimated inventory of chemical components.

The DOE has many reasons for obtaining and tracking non-radiological information about the TRU waste inventory destined for WIPP. For example, the DOE tracks the waste materials that go into the repository (i.e., CPR materials) because they may affect gas generation in the

repository. As another example, the DOE tracks the chemical components of the waste going into the repository because they affect the solubility of actinides in the waste. The DOE needs to know the non-radiological properties of the waste not only for PA but also to support safe transportation of the waste and operation of the facility.

The DOE has established a system of tracking the non-radiological waste parameters of the waste destined for WIPP. It involves a description of the waste streams in terms of their waste matrix codes (WMCs) and associated final waste forms, and their WMPs.

The WMPs, final waste forms, and WMCs are defined in the Glossary, and were previously described in the TWBIR Revision 2 (DOE 1995b). The final waste forms and WMCs are also described in detail in the DOE Waste Treatability Group Guidance (DOE 1995c).

The following WMP descriptions were excerpted from the TWBIR Revision 2 (DOE 1995b) and are operative in this document:

- Iron-base metal/alloys This designation is meant to include iron and steel alloys in the waste and does not include the waste container materials. This also includes an iron-base metallic phase associated with any vitrification process, if applicable;
- Aluminum-base metal/alloys Aluminum or aluminum-base alloys in the waste materials;
- Other metal/alloys All other metals found in the waste materials (such as copper, lead, zirconium, and tantalum). The lead portion of lead rubber gloves/aprons is also included in this category;
- Other inorganic material Includes inorganic non-metal waste materials such as concrete, glass, firebrick, ceramics, graphite, sand, and inorganic sorbents;
- Vitrified material This refers to waste that has been melted or fused at high temperatures with glass-forming additives such as soil or silica in appropriate proportions to result in a homogeneous glass-like matrix (note that any unoxidized metallic phases, if present, are included in the iron-base metal/alloys waste material parameter);
- Cellulosic material Includes those materials generally derived from high polymer plant carbohydrates. Examples are paper, cardboard, kimwipes, wood, cellophane, and cloth;
- Rubber material Includes natural or manmade elastic latex materials. Examples are Hypalon®, neoprene, surgeons' gloves, and leaded-rubber gloves (rubber part only);
- Plastic material Includes generally manmade materials, often derived from petroleum feedstock. Examples are polyethylene, polyvinylchloride, Lucite<sup>®</sup>, and Teflon<sup>®</sup>;
- Solidified inorganic material Includes any homogeneous materials consisting of sludge or aqueous-base liquids that are solidified with cement, Envirostone<sup>®</sup>, or other solidification agents. Examples are wastewater treatment sludge, cemented aqueous liquids, and inorganic particulates. If a TRU waste site has not reported cement used as part of the solidification

process in the cement (solidified) waste material parameter, the density of the cement may be included in this field;

- Solidified organic material Includes cemented organic resins, solidified organic liquids, and sludges;
- Cement (solidified) Includes the cement used in solidifying liquids, particulates, and sludges. If the field for a solidified final waste form is left blank, it means that either cement is not the solidifying agent or that the cement is included in another waste material parameter field such as solidified inorganic material or other inorganic materials; and
- Soil Generally consists of naturally occurring soils that have been contaminated with radioactive waste materials at a high enough level to be considered TRU waste.

Packaging material parameters are described in further detail in Section 3.2.2 and Appendix D. Packaging material parameters were reported from the material parameter descriptions described in the TWBIR Revision 2 (DOE 1995b). These parameters were determined by weights defined as follows:

- Steel The weight of the steel part of the packaging from container information provided by the TRU waste sites. Any necessary overpacking is included in the weight;
- Plastic The weight of any plastic packaging submitted by the TRU waste sites. When the weight of a rigid liner is not given, a 90-mil high density polyethylene (HDPE) liner is assumed; and
- Lead The weight of the lead shielding in an RH-TRU canister is assumed if not provided by the TRU waste sites (see Appendix D for details).

Final waste form refers to the expected physical and chemical form of a waste stream after it is ready for disposal (i.e., once the waste has been processed, treated, or repackaged as necessary and is ready for shipment to WIPP). Each final waste form consists of one or more WMCs. The WMCs associated with each of the final waste forms listed below are included in the TWBIR Revision 3 (DOE 1996a, Table 1-2). The purpose of the final waste form is to group waste streams that are expected to have similar physical and chemical properties at the time of disposal. A final waste form was assigned to all reported WIPP waste streams by each of the sites. The final waste forms are:

- Solidified inorganic material,
- Salt.
- Solidified organic material,
- Soil,
- Uncategorized metal (metal waste other than lead and/or cadmium),

- Lead/cadmium metal,
- Inorganic non-metal,
- Combustible material,
- Graphite,
- Heterogeneous debris,
- Filter material,
- Excluded waste streams (excluded from disposal at WIPP), and
- Unknown (excluded from disposal at WIPP).

The purpose of the WMCs is to aid in categorizing mixed waste streams into groups based on their different physical and chemical characteristics. The sites assign the WMCs for all of their mixed waste streams and generally assign them for their non-mixed waste streams as well. The WMC system description and terminology used by the sites and the DOE is detailed in the *DOE Waste Treatability Group Guidance* (DOE 1995c). The WMCs are numerous and are therefore not all listed here. However, the summary category groups (referred to as matrix parameter categories in the "DOE Waste Treatability Group Guidance") are debris (S5000), homogeneous solids (S3000), and soil/gravel (S4000).

There are several WMCs in each of these summary category groups. For example, the debris (S5000) summary category group is divided into inorganic debris (S5100), organic debris (S5300), heterogeneous debris (S5400), and unknown/other debris (S5900). The inorganic debris group (S5100) is divided into metal debris (S5110), inorganic nonmetal debris (S5120), and unknown/other inorganic debris (S5190). The metal debris (S5110) group is divided into metal debris without lead or cadmium (S5111), and so on. These are detailed in DOE 1995c.

#### 3.2.1 Waste Materials

As part of the data call for TWBIR - 2004, the sites were asked to provide information about the materials contained in the waste. For each waste stream, they were asked to designate a final waste form and to provide the average density of each of the WMPs in the waste stream. In some cases, the sites provided minimum and maximum WMP densities.

For those waste streams where the site did not provide information regarding WMPs, the WMPs were estimated using the methods described in the Computational Methodology (LANL 2003) and in the WMP correction packages as identified in Appendix M. In summary, when partial information was provided (i.e., the minimum value or maximum value but not the average), it was used to calculate the average WMP densities (which were needed for PABC). When WMP density information was not provided for a waste stream, the average density was inferred by identifying an analogous waste stream, and mapping the WMP densities from that waste stream into the waste stream that lacked WMPs. For some sites such as LANL, where WMPs were reported in TWBIR Revision 2 (DOE 1995b), WMPs were traced back to that document. If this

historic information was not available, the other waste streams from that site were reviewed to identify waste streams with similar final waste forms, WMCs, and waste stream descriptions. If a similar waste stream was identified, the WMP densities from that waste stream (source) were attributed to the waste stream that lacked WMP densities (destination waste stream). In both cases, the packaging material parameters were edited using the waste packaging densities discussed in Section 3.2.2 as appropriate for the type of container(s) in the assigned waste stream.

Waste streams were sometimes comprised of more than one container type (for example, 55-gallon drums and standard waste boxes [SWBs]). In these instances, when the site provided only one set of WMP densities, those WMP densities were used for both container types, except for the packaging material parameters, which were modified for the container type using the waste packaging densities given in Section 3.2.2. The waste profiles in Appendices I and J (non-WIPP and WIPP waste streams, respectively) have a weighted average of the WMP densities for all container types used in a waste stream. If the site provided a WMP list for each container type, those lists were maintained in the TWBID Revision 2.1 and a weighted average of the WMPs for all container types was used in the waste profiles generated by TWBID, Revision 2.1, Data Version D.4.16 (LANL 2005).

In some cases, the sites provided incomplete WMP information from which the needed densities could be inferred. Specifically, the WMP average densities were inferred from minimum and maximum WMP data. However, the minimum and maximum values were not used for the CRA-2004 (DOE 2004c) PA or for the PABC (Leigh et al. 2005a; Leigh et. al. 2005b) and they were not reported in the TRU waste inventory estimate.

#### 3.2.1.1 Roll-Up of Final Waste Form Volumes

Table 4 presents a roll-up of the final waste form volumes for CH- and RH-TRU waste. Every WIPP waste stream in the TWBID Revision 2.1 (LANL 2005) has been assigned a final waste form. The total volume for each of the final waste form categories is calculated by summing the unscaled waste stream volume components (emplaced, stored, and projected) with the same final waste form designation for all waste streams, from all sites, destined for WIPP.

Table 4. Transuranic Waste Inventory for WIPP

| E' 117 ( E              | Gt IVI              | Projected         | Emplaced | Anticipated |
|-------------------------|---------------------|-------------------|----------|-------------|
| Final Waste Forms       | Stored Volumes      | Volumes           | Volumes  | Volumes     |

#### 3.2.1.2 Waste Material Parameter Average Densities for Each Final Waste Form

Tables 5 through 24 present the WMP average densities for each final waste form in CH-TRU and RH-TRU waste. Tables 5 through 15 present CH-TRU waste. Tables 16 through 24 present RH-TRU waste. These tables include the rolled up WMP average densities for each final waste form and the rolled up waste volumes by site that contributed to the total final waste form volume. These volumes are broken out into stored and projected volumes, and the total volume of waste by site for each final waste form. The emplaced volume is shown separately. The final waste forms that have an emplaced waste CH-TRU waste volume are combustible, filter, heterogeneous, inorganic non-metal, lead/cadmium metal, salt, solidified inorganics, and uncategorized metal. No RH-TRU waste is emplaced at the WIPP at this time.

For example, Table 5 presents the WMP average densities for all CH-TRU waste streams with the combustible final waste form designation. The table shows roll-ups for stored, projected, and emplaced CH-TRU waste with the combustible final waste form designation for each site. This information is derived by summing the component volumes for each CH-TRU waste stream in the combustible category at each site.

Calculation of the WMP average densities in a final waste form requires combining data from the individual waste streams with the same final waste form designation as follows:

$${}^{WM}\boldsymbol{m}_{i}^{j} = ({}^{WM}\boldsymbol{p}_{i}^{j}) (\boldsymbol{v}_{i}^{j})$$

$${}^{WM}\boldsymbol{M}^{j} = \sum {}^{WM}\boldsymbol{m}_{i}^{j}$$

$${}^{WM}\boldsymbol{P}^{j} = {}^{WM}\boldsymbol{M}^{j} / \boldsymbol{V}^{j}$$

$$(6)$$

Where

| is the mass of the waste material (WM) in waste stream i with a final form   |
|--|
| designation j  |
| is the average density of the WM in waste stream i with a final form         |
| designation j  |
| is the volume of waste stream i (stored + projected + emplaced) with a final |
| form designation j   |

| is the total volume of all waste streams with a final form designation j     |
| is the average density of the WM in all waste streams with a final form      |
| designation j.   |
|  |

At the time of the inventory cutoff date (September 30, 2002, portions of some waste streams had been shipped to the WIPP and emplaced and others were yet to be characterized and shipped. If there was no emplaced waste for a waste stream as of the inventory date, then the emplaced volume in the equation above for that waste stream was zero. If there was no emplaced waste for any of the waste streams within the final waste forms considered, the total emplaced volume for the final waste form was also zero.

There are several notable differences in the WMP average densities for the roll-ups by final waste form when compared to the TWBIR Revision 3 (DOE 1996a). These changes are tabulated and discussed in Appendix B.

#### 3.2.1.3 WIPP-Scale Waste Material Parameter Densities

Performance assessments conducted in support of the WIPP have been predicated on the assumption that waste materials are distributed homogeneously throughout the repository. As a result, a WIPP-scale average estimated value for waste material densities is needed for PA. The estimated WIPP-scale WMP average densities for CH- and RH-TRU wastes in support of the PABC (Leigh et al. 2005a; Leigh et al. 2005b) are presented in Tables 25 and 26, respectively. These are equivalent to CRA-2004 (DOE 2004c) Tables F25 and F26 in Attachment F to Appendix DATA of TWBIR Revision 3 (DOE 1996a) Tables 2-2 and 2-3, respectively. Note also that the TWBIR Revision 3 (DOE 1996a) Tables 2-2 and 2-3 are the same as TWBIR Revision 2 (DOE 1995b, Tables 3-2 and 3-3, respectively). Although these tables in TWBIR Revisions 2 and 3 contain the minimum, maximum, and average densities for the WMP, this report contains only one value of density of the waste representing the best estimate for the WMP.

The WMP densities were combined, or "rolled up," for the whole repository according to the Computational Methodology (LANL 2003). Specifically, the roll-up of WMP densities required summing the WMP densities from all of the WIPP waste streams reported by the sites. A weighted average value for the WMP based on the individual waste stream volumes in the total inventory was calculated from the WMP densities provided by the sites as shown below:

$${}^{WM}m_i = ({}^{WM}p_i) (v_i)$$

$${}^{WM}M = \sum {}^{WM}m_i$$

$${}^{WM}P = {}^{WM}M/V$$
(7)

Where

 $^{WM}m_i$  is the mass of the WM in waste stream i is the density of the WM in waste stream i  $v_i$  is the unscaled volume of waste stream i (stored + projected + emplaced) is the total mass of WM in all waste streams V is the unscaled volume of all waste streams is the average density of the WM in all waste streams

## 3.2.2 Packaging Materials

The PA assumption that materials are distributed homogeneously throughout the repository also applies to packaging materials. As a result, a WIPP-scale average value for packaging material densities is needed for PA. The WIPP-scale packaging (container) material densities for CH- and RH-TRU wastes in support of the PABC (Leigh et al. 2005a; Leigh et al. 2005b) are presented in Table 27. This information is equivalent to that presented in Table 1-3 in TWBIR Revision 2 (DOE 1995b).

Analysis of the packaging material information submitted by the sites identified inconsistencies in reporting among the sites. Therefore, adjustments were made at the waste-stream level to achieve consistency among the waste streams. In particular, a consistent set of densities for packaging materials for different types of containers was used unless otherwise reported by the site. Table 1-3 of the TWBIR Revision 2 (DOE 1995b) identified the packaging materials and packaging material densities for the waste containers that were being used at that time. These values were also used in TWBIR - 2004. Since the time of the TWBIR Revision 2, the sites have begun using ten-drum overpacks (TDOPs) for packaging waste. The calculated packaging material densities for TDOPs are presented in Appendix D, Packaging Materials.

In addition, sites have also reported that they use 85- and 100-gallon drum overpacks. The CH Transuranic Package Transporter-II (TRUPACT-II) Authorized Methods for Payload Control (TRAMPAC) document (DOE 2004b) has been revised to add the 85-gallon drum as an authorized payload container for shipment in the TRUPACT-II, and to add the 100-gallon drum as an authorized payload container in the HalfPACT and the TRUPACT-II. The applicable section of the TRAMPAC document has also been revised to specify a range of sizes (75 to 88 gallons) for a container identified as an "85-gallon drum."

Development of the TRUPACT-III is underway, which will allow shipment of standard large boxes (SLBs) to WIPP for disposal. The CPR estimates for SLBs have not been included in this inventory estimate, but will be included in the next update where applicable.

#### 3.2.3 Chemical Components in Transuranic Waste

As part of the data call for TWBIR - 2004, the sites were asked to provide information about the chemical components of the waste. The sites were asked about complexing agents (acetate, citrate, oxylate, ethylenediaminetetraacetic acid (EDTA), oxyanions (nitrate, sulfate, and phosphate), cement, and pyrochemical salts.

| Table 27. | <b>Assumed Packaging Material Densities</b> <sup>1</sup> |
|-----------|--|
|           |  |

| Container Configuration                            | Steel (kg/m³) | Plastic (kg/m <sup>3</sup> ) | Lead (kg/m³) | Volume (m <sup>3</sup> ) <sup>2</sup> |
|--|---------------|------------------------------|--------------|---------------------------------------|
| 55-gallon drum                                     | 131           | 37                           | 0            | 0.208                                 |

| Ten-Drum Overpacks                                 | 218           | 16                           | 0            | 4.79                                  |

<sup>&</sup>lt;sup>1</sup> This table was used when sites did not report container volumes. Information in this table was taken from DOE (1995) and Appendix D of this document.

This section presents the summary of the chemical components that are present in the solidified TRU waste inventory in support of the PABC (Leigh et al. 2005a; Leigh; et al. 2005b). Specifically, complexing agents, oxyanions, and cement are calculated as the sum of the constituents found in anticipated waste scheduled for delivery to WIPP and any waste that has already been placed in the repository. The information provided is based on input from the TWBIR Revision 3 (DOE 1996a), TWBID Revision 2.1 (DOE 1995b), and analyses of this information. The methods used to estimate the masses of cement, complexing agents, and oxyanions are discussed in Howard (2005) for cement, Crawford and Leigh (2003) for complexing agents, and Crawford (2005) for oxyanions, respectively. A brief discussion of pyrochemical salts is presented in Appendix A.

## 3.2.3.1 Cement Content in Solidified Transuranic Waste

The PA for the CRA-2004 (DOE 2004c) and the PABC (Leigh et al. 2005a; Leigh et al. 2005b) required an estimate of the mass of cement in waste expected for disposal in the repository. This estimate was updated for the PABC and is reported in this report. An estimate of the cement mass for the CCA (DOE 1996b) was given in Appendix B-7 of the TWBIR Revision 3 (DOE 1996a). While the waste stream volumes reported by the TRU waste sites in TWBIR - 2004 have changed when compared to the TWBIR Revision 3 volumes, the waste streams identified by the sites at the time of the TWBIR Revision 3 as containing cement have not changed. However, the sites have not reported cement densities consistently over time. Therefore an analysis (Howard 2005) was performed to identify waste streams that contained cement using newly reported cement densities where they were available and assigning cement densities to waste streams where cement was listed in waste descriptions but not reported as waste material parameters. The total estimated mass of cement in the scaled solidified waste streams for TWBIR - 2004 is  $8.80 \times 10^6 \text{ kg} (1.94 \times 10^7 \text{ lb})$  (see Table 29). This estimate of cement mass in the WIPP repository is slightly larger than the estimate made for the CCA (DOE 1996b)  $(8.54 \times 10^6 \text{ kg} [1.88 \times 10^7 \text{ lb}])$ .

<sup>&</sup>lt;sup>2</sup> Container volumes differ from WWIS container volumes.

## 3.2.3.2 Complexing Agents (Organic Ligands) in Transuranic Waste

The DOE tracks the mass of complexing agents going into the repository because of their impact on solubility of actinides in the waste. In the latest request by DOE for data from the sites, none of the sites updated or modified their estimates of complexing agents in the waste streams that had been reported previously in the TWBIR Revision 3 (DOE 1996a). When applicable, the sites did report the expected masses of complexing agents in waste streams added to their inventory since publication of the TWBIR Revision 3.

The TWBIR Revision 3 (DOE 1996a) contained information on complexing agents that was used in the PA in support of the CCA (DOE 1996b). TWBIR Revision 3 presented two estimates for complexing agents in the WIPP repository: one assuming reduction of complexing agents due to thermal treatment and one without that assumption. Since publication of the TWBIR Revision 3, the DOE's strategy for wastes at the INL has changed, and incineration operations for INL TRU waste did not occur as planned. Therefore, the data reported in Appendix B-4 of the TWBIR Revision 3 without the thermal treatment assumption was used in the calculation of mass of complexing agents for the CRA-2004 (DOE 2004c) and the PABC (Leigh et al. 2005a; Leigh et al. 2005b) as reported in Table 28.

The inventory information reported in TWBIR Revision 3 (DOE 1996a) did not provide a breakout of the waste streams that contained complexing agents. Therefore, an analysis was completed (Crawford 2004) to delineate this waste stream information. Appendix L, Table L-1, includes the waste streams containing complexing agents with the waste-stream specific information supplied by the sites for the CRA-2004 (DOE 2004c) and the PABC inventory (Crawford 2004).

Only two sites reported complexing agents in waste streams: Rocky Flats Environmental Technology Site (RFETS) and Hanford Office of River Protection (Hanford RP). For their new waste streams, RFETS reported that EDTA might be present at trace levels (< 1 wt%) in their waste. Hanford RP identified sodium acetate and sodium oxalate in their new waste streams. The total mass of acetic acid, sodium acetate, citric acid, sodium citrate, oxalic acid, sodium oxalate, and sodium EDTA estimated for the WIPP repository are reported in Table 28.

Table 28. Mass of Potential Complexing Agents in the WIPP Repository

| Compound       | RFETS (kg) | LANL (kg) | Hanford RP<br>(kg) | Total (kg) |
|----------------|------------|-----------|--------------------|------------|
| Acetic Acid    | 132        | 10        |                    | 142        |
| Sodium Acetate | 1,110      |           | 7,400              | 8,510      |
| Citric Acid    | 90         | 1,100.5   |                    | 1,190.5    |
| Sodium Citrate | 400        |           |                    | 400        |
| Oxalic Acid    | 90         | 13,706    |                    | 13,796     |
| Sodium Oxalate |            |           | 33,940             | 33,940     |
| EDTA           | 25.6       |           |                    | 25.6       |

Data Source: Crawford and Leigh (2003)

Only a slight increase in EDTA was reported with this updated information over that reported in TWBIR Revision 3 (DOE 1996a). The increase comes from one waste stream at RFETS that contains trace

amounts of EDTA and is reported as the upper limit of expected concentration. Waste from Hanford RP waste tanks is also included in Table 28, and represents a significant increase in sodium acetate and sodium oxalate that had not been reported for the TRU inventory in TWBIR Revision 3.

### 3.2.3.3 Mass of Oxyanions in Transuranic Waste

The PABC (Leigh et al. 2005a; Leigh et al. 2005b) required an estimate of the mass of nitrate, sulfate, and phosphate in waste expected for disposal in the repository. An estimate of the oxyanion masses for the CCA (DOE 1996b) was given in Appendix B-6 of the TWBIR Revision 3 (DOE 1996a). The TRU waste sites did not report any new information about oxyanions for TWBIR - 2004, with the exception of waste streams reported by Hanford RP and LANL, and revised values for a waste stream at RFETS. An analysis was completed to determine the oxyanions by waste stream (Crawford 2005). The mass of nitrate, sulfate, and phosphate in the repository was calculated for the PABC as the sum of the mass of nitrate, sulfate, and phosphate in the TWBIR Revision 3 (DOE 1996a) adjusted for the new waste stream volumes from this update plus the mass of these elements reported by the sites for their new waste streams. Appendix L, Table L-2, includes the waste streams with the waste-stream specific information about the mass of nitrate, sulfate, and phosphate that was supplied by the sites for TWBIR - 2004. Table 29 presents the mass of nitrate, sulfate, phosphate and cement for disposal in the WIPP repository for the PABC.

The estimate of nitrate mass in the WIPP repository  $(2.67 \times 10^6 \text{ kg } [5.88 \times 10^6 \text{ lb}])$  is larger than the estimate made for the CCA (DOE 1996b) which was  $1.62 \times 10^6 \text{ kg } (3.57 \times 10^6 \text{ lb})$ . The increase in nitrate mass is due primarily to larger volumes projected for existing waste streams and the added waste streams from Hanford RP. The estimate of sulfate mass in the WIPP repository  $(4.43 \times 10^5 \text{ kg } [9.76 \times 10^5 \text{ lb}])$  is less than the estimate made for the CCA, which was  $6.33 \times 10^5 \text{ kg } (1.39 \times 10^6 \text{ lb})$ . The estimate of phosphate mass in the WIPP repository  $(1.05 \times 10^5 \text{ kg } [2.31 \times 10^5 \text{ lb}])$  is significant when compared to the CCA. There was no phosphate of reportable quantity given by the generator sites in the TWBIR Revision 3 (DOE 1996a). The primary source of phosphate in the current estimate is the tank waste from Hanford RP.

Table 29. Mass of Oxyanions and Cement In the WIPP Disposal Inventory

| Chemical  | Mass Contained in the Disposal Inventory |
|-----------|--|
| Component | (kg)                                     |
| Nitrate   | $2.67 \times 10^6$                       |
| Sulfate   | $4.43 \times 10^5$                       |
| Phosphate | $1.05 \times 10^5$                       |
| Cement    | $8.80 \times 10^6$                       |

Data Sources: Crawford (2005) and Howard (2005)

# 3.2.3.4 Pyrochemical Salts in Waste Isolation Pilot Plant Transuranic Waste

Five waste streams at LANL, one waste stream at Lawrence Livermore National Laboratory (LLNL), and seven waste streams at RFETS have been identified as containing pyrochemical salts. The pyrochemical salt waste streams are reported in Appendix A.

## 3.3 Transuranic Waste Radionuclide Inventory

The sites were asked to provide information about the radiological components in the waste they intend to ship to WIPP. For each waste stream they were asked to specify the radionuclide activity concentrations (in Ci/m³) and to provide the generation or last assay date for each waste stream. In some cases, the sites provided all of the information required; in other cases, they did not.

Where the sites did not provide adequate information regarding the radiological components of a waste stream, radionuclide activities were estimated using the methods described in the Computational Methodology (LANL 2003) and in the radionuclide correction package as identified in Table M.5 in Appendix M. As more information became available regarding TWBIR Revision 2 (DOE 1995b) waste streams and how they had been reassigned for TWBIR - 2004, the historic radionuclide data were used to define radionuclide activity concentrations (Sparks 2004; Trone 2004; Leigh and Trone 2004).

When no other radionuclide information was available, radionuclide data for comparable waste streams at the same site were mapped into waste streams with missing data. For 73 waste streams without data, this mapping was accomplished by first matching handling (RH and CH) and then the WMC for each site. Then, if there were no matches, the waste description was used to find a comparable waste stream. In this way, a waste stream requiring radionuclide data was matched to a waste stream that was generated by the same or very similar process.

All of the radionuclide data were decayed to a common base year of CY 2001 (December 31, 2001) using Oak Ridge National Laboratory Isotope Generation and Depletion Code, Version 2.2 (hereafter referred to as ORIGEN 2.2) (Croff 1983; Croff 1980). ORIGEN 2.2 is a computer code that calculates the buildup and decay of radionuclides. ORIGEN 2.2 uses a matrix exponential method to solve a large system of coupled, linear, first-order ordinary differential equations with constant coefficients.

The ORIGEN 2.2 half-life data are identical to the half-life data used (via ORIGEN 2.1; ORNL 2002) for the TWBIR Revision 3 (DOE 1996a) in 1996. The results obtained for data in 1996 using ORIGEN 2.1 and those obtained using the current version of ORIGEN 2.2 for 1996 data would be identical. Therefore, the only differences expected between the data obtained in 1996 using ORIGEN 2.1 and those reported for TWBIR - 2004 using ORIGEN 2.2 are those related to time.

Updated waste stream volumes were used to calculate waste stream radionuclide activity from the decayed ORIGEN 2.2 radionuclide activity concentrations as shown in the following equation:

$$a(RN)_{Disposal} = \alpha(RN) \cdot v_{Disposal} \tag{8}$$

Where

 $a(RN)_{Disposal}$  is the activity of the radionuclide RN in the scaled waste stream volume is the decayed radionuclide activity in Ci/m<sup>3</sup> from ORIGEN 2.2 for radionuclide RN is the waste stream disposal volume for CH-TRU or RH-TRU waste

More information on how  $v_{Disposal}$  was calculated can be found in Section 3.1.

The WIPP-scale (see section 3.1.1 for discussion on WIPP-Level roll-up scaling) radionuclide activities were calculated as shown in the following equations for both CH- and RH-TRU wastes. In the first step, the activities of each radionuclide in the scaled waste stream volumes ( $a(RN)_{Disposal}$ ) are summed for all

waste streams to give the total activity for each radionuclide in CH- and RH-TRU waste in the repository. In the second step, the total activity for each radionuclide in CH- and RH-TRU waste in the repository is divided by the volume limit (168,485 m³ [5,950,000 ft³] for CH-TRU waste and 7,079 m³ [250,000 ft³] for RH-TRU waste) to give the activity concentration for a radionuclide in CH- or RH-TRU waste in the repository.

$$A(RN) = \sum a(RN)_{Disposal}$$

$$\hat{A}(RN) = A(RN)/Limit$$
(9)

Where

A(RN)is the total activity (Ci) for a radionuclide in CH- or RH-TRU waste in the repository (after scaling) $\hat{A}(RN)$ is the activity concentration for a radionuclide in CH- or RH-TRU waste in the repository (Ci/m³) $a(RN)_{Disposal}$ is the activity (Ci) of the radionuclide RN in the scaled waste stream volumeLimitis  $168.485 \text{ m}^3 (5.950.000 \text{ ft}^3)$  for CH-TRU waste and  $7.079 \text{ m}^3 (250.000 \text{ ft}^3)$  for RH-

TRU waste

## 3.4 Site-Level Roll-up of Radionuclide Activities

Tables 30 and 31 provide the site-specific radionuclide inventory estimates in total curies decayed through CY 2001 for CH- and RH-TRU waste, respectively. The data shown in Tables 30 and 31 are the radionuclide inventories as the sum of the actual stored and projected volumes (not scaled) reported by the sites.

#### 3.5 Waste-Stream-Level Radionuclide Activities

The radionuclide activities (Ci) in the scaled waste stream volumes for the CH-TRU waste streams included in the estimate of volume for the PABC (Leigh et al. 2005a; Leigh et al. 2005b) are given in Appendix E, Table E-1. The radionuclide activities (Ci) in the scaled waste stream volumes for the RH-TRU waste streams included in the estimate of volume for PABC are given in Appendix E, Table E-2.

## 3.6 Waste Isolation Pilot Plant-Level Roll-up of Radionuclide Activities

The waste profiles in Appendices I, J, and K include radionuclide concentrations for each waste stream. These radionuclide concentrations have been decayed to a common base year, but are not scaled for a full repository.

Table 32 presents the WIPP-level roll-up of radionuclide activities for the disposal inventory (scaled for a full WIPP repository) in Ci/m<sup>3</sup> and total Ci decayed through CY 2001 for both CH-TRU and RH-TRU waste. Table 32 corresponds to Table 3-1 in TWBIR Revision 3 (DOE 1996a).

A comparison of TWBIR Revision 3, Table 3-1 (DOE 1996a) radionuclide information to the radionuclide information reported in Table 32 is given in Appendix B, Table B-27 for CH-TRU waste and Table B-28 for RH-TRU waste. The overall activity for all radionuclides has decreased by nearly 25 percent. Five radionuclides made up 99 percent of the CH-TRU waste curies in the TWBIR Revision 3 and the same five make up 97 percent of the total CH-TRU waste curies in this report. The results for

RH-TRU waste show substantial variations in individual radionuclide activity. An overall increase in activity of 60 percent was observed with this update. The five most abundant RH-TRU waste isotopes in the TWBIR Revision 3 ( $^{137m}$ Ba,  $^{137}$ Cs,  $^{241}$ Pu,  $^{90}$ Sr, and  $^{90}$ Y) are still the most abundant in the TWBIR - 2004. These five radionuclides made up 96 percent of the RH-TRU waste curies in the TWBIR Revision 3 and make up 98 percent of the total RH-TRU waste curies in TWBIR - 2004.

Table 30. CH-TRU Waste Curies on a Site-by-Site Basis\*

NR=Not reported by sites. Data Source: TWBID Revision 2.1, Version 3.13, Data Version D.4.16, LANL 2005.

Data decayed through 2001.

Total curies estimated by assuming a volume of 5,950,000 cubic feet for CH-TRU waste and 250,000 cubic feet for RH-TRU waste.

NR=Not reported by sites. Data Source: TWBID Revision 2.1, Version 3.13, Data Version D.4.16, LANL 2005.

Data decayed through 2001.

Total curies estimated by assuming a volume of 5,950,000 cubic feet for CH-TRU waste and 250,000 cubic feet for RH-TRU waste.

Table 32. WIPP Disposal Radionuclide Inventory for the CRA<sup>1,2</sup>—Continued

# 3.7 Non-Waste Isolation Pilot Plant and Future Potential Waste

This section identifies waste streams not included in the WIPP inventory used for the PABC (Leigh et al. 2005a; Leigh et al. 2005b). The waste permitted to come to WIPP is restricted by radionuclide activity limits, volume, and purpose of generation (i.e., waste generated only from defense activities). Non-WIPP waste streams are summarized in Section 3.8 and waste profiles and waste streams are presented in Appendix I.

Other restrictions to the waste result from how the waste has been managed at the TRU waste sites. Some materials that have not been declared TRU waste by the DOE TRU waste sites at this time may become TRU waste in the future. Some waste has been identified in the TRU inventory but the option for processing has not been determined at this time. These possible future waste streams may ultimately become eligible for shipment to WIPP and are discussed in Section 3.9.

### 3.8 Non-Defense TRU Waste and Waste Isolation Pilot Plant Future Potential Waste

The DOE has several categories of waste that are currently not acceptable for disposal in WIPP. These are summarized below:

- Non-Defense Waste—The National Security Program (Public Law 96-164, 1980, National Security
  and Military Applications of Nuclear Energy Authorization Act of 1980, 93 Stat. 1259), which
  authorized the construction of the WIPP, states that the WIPP is to be a defense waste repository.
  Therefore, wastes that are identified as non-defense can not be disposed in the WIPP. Some waste
  streams from sites for which a defense determination has not been made are identified in Table 33.
- Pre-1970 buried TRU Waste—Several sites (i.e., LANL, Savannah River Site (SRS), SNL, Hanford Site, INL, ORNL, and West Valley Demonstration Project) have TRU wastes that were buried prior to 1970. INL is currently preparing pre-1970 buried waste for shipment to WIPP. Only INL has included pre-1970 buried waste in the WIPP shippable inventory at this time.

Data decayed through 2001.

Total curies estimated by assuming a volume of 5,950,000 cubic feet for CH-TRU waste and 250,000 cubic feet for RH-TRU waste.

- Classified Waste—Some classified TRU waste, such as TRU-contaminated classified materials
   (materials used in weapons production), is now acceptable for disposal at WIPP. These materials are
   classified for security and national defense purposes due to their physical shape or form and may
   include graphite, metal, tooling, and plastic materials. The same characterization and associated QA
   activities currently required under the WIPP program will be implemented for the characterization of
   classified waste using selected personnel.
- Polychlorinated Biphenyl (PCB) waste—The EPA Region 6 approved the disposal of non-liquid PCB-contaminated TRU waste (PCB/TRU waste) and PCB/TRU waste mixed with hazardous waste (PCB/TRU mixed waste) at the WIPP in May 2003. However, at the time the inventory estimate was prepared for the PABC (Leigh et al. 2005a; Leigh et al. 2005b), this approval had not been received. Therefore PCB/TRU waste > 50 ppm was not included in this updated inventory.
- RH-TRU waste that exceeds 23,000 Ci/m³ (650 Ci/ft³)—This limit is from the LWA (U.S. Congress 1996).

Table 33. Possible Future TRU Waste for WIPP

# 3.9 Possible Future Waste Isolation Pilot Plant Waste

Categories of waste that eventually may become acceptable for disposal at WIPP include the following:

- Unknown Potential future waste may come from waste streams currently declared "unknown." (see Table 33). These wastes have not been characterized adequately to determine the final waste form and/or other significant parameters. If these wastes are characterized and meet the WIPP Waste Acceptance Criteria (WAC) (DOE 2004a), they will be included in the WIPP inventory in the future.
- Defense determination pending Only one waste stream has been identified as requiring a defense determination. Babcock and Wilcox in Lynchburg, VA, currently has approximately 45 m³ (1,590 ft³) of TRU waste in on-site storage silos. Virtually all of the material was generated from the Light Water Reactor Extended Burn-Up Program. That program was responsible for sending test elements of reactor fuel to various hot cells, including the one at Lynchburg. The waste consists mostly of cellulosics, rubber, and lead-lined gloves.
- Newly identified TRU waste Brookhaven National Laboratory (BNL) has identified an existing legacy 17,500-lb concrete vault stored at the Hazardous Waste Management Facility as TRU waste based on recalculation of <sup>239</sup>Pu curie content. The vault holds five plutonium foils (TRU waste) and other non-TRU waste constituents including Brookhaven Linear Isotope Production (BLIP) waste, and cesium and cobalt sources embedded in concrete. The vault must now be managed as TRU waste.
- The Beryllium Block waste stream at INL includes beryllium blocks and outer shim control cylinders from the Advanced Test Reactor. The radionuclide concentrations are too great to be considered in this update, but may be considered in the future.

# 3.10 Emplacement Materials

The inventory of CPR materials used by WIPP Waste Handling Operations (WHO) to facilitate waste emplacement was estimated to support the PABC (Leigh et al. 2005a; Leigh et al. 2005b). This information was not used for the CRA-2004 PA but has been calculated as a best estimate based on current knowledge of the packaging expected to be used by the sites for shipment (Burns 2005). The TRAMPAC (DOE 2004b) allows certain container types to be transported in the TRUPACT-II. These are 55-gallon drums, 85-gallon drums, 100-gallon drums, SWB, and TDOPs. One standard large box container type (5 ft x 5 ft x 8 ft box) was also added as a possible future transportation container to these calculations (Burns 2005).

The WIPP was designed to receive both CH- and RH-TRU waste. CH-TRU waste emplaced in the WIPP is in seven-packs of 55-gallon drums and/or pipe overpack components (POCs), SWBs, and TDOPs. RH-TRU waste has not been shipped to the WIPP to date.

The WIPP WHO uses several materials to facilitate the emplacement of TRU waste, and magnesium oxide (MgO) is used as an engineered barrier. The amount of MgO emplaced is based on a safety factor and is subject to change based on the amount of CPR in the repository. The CPR, however, has been estimated for each payload configuration expected to be emplaced in the repository (Burns 2005). Plastic and cellulosic materials are used to emplace CH-TRU waste. The MgO is placed on top of the containers

and comes in a woven plastic bag called a "supersack." RH-TRU waste will be emplaced in boreholes in the salt. Currently, there is no CPR materials used for RH-TRU waste emplacement.

The materials used to emplace CH-TRU waste are:

- Polyethylene (PE) slip-sheets for the seven-packs of 55-gallon drums and/or POCs, four-packs of 85-gallon drums, three-packs of 100-gallon drums, and the MgO supersacks (plastics);
- Fiberboard slip-sheet for the SWB and TDOP (cellulosic material);
- Woven polypropylene supersacks containing MgO (plastic material/MgO);
- Cardboard stabilizers for the supersacks (cellulosic material); and
- Stretch wrap for the seven-packs (plastic material).

There is no rubber materials used for CH- or RH-TRU waste emplacement. For CH-TRU waste, the total mass of each of the emplacement materials (plastic, cellulosic, and MgO) was calculated as of the inventory date. The WWIS was modified in March 2005 to begin tracking the emplaced quantities of MgO, as well as the added emplacement materials (e.g., slip sheets and shrink wrap). The relevant information is provided in Table 34.

Table 34. Estimates of Materials Used to Facilitate Emplacement of Waste in the WIPP

| CPR Component | From Supersacks<br>(kg) | From Emplacement<br>Packs (kg) | Total Emplacement<br>Materials (kg) |
|---------------|-------------------------|--------------------------------|-------------------------------------|
| Cellulose     | 1.17 x 10 <sup>5</sup>  | 8.98 x 10 <sup>4</sup>         | $2.07 \times 10^5$                  |
| Plastic       | $3.85 \times 10^5$      | $1.10 \times 10^6$             | $1.48 \times 10^6$                  |
| Rubber        | 0                       | 0                              | 0                                   |

# **EXECUTIVE SUMMARY**

The U.S. Department of Energy's (DOE's) Waste Isolation Pilot Plant (WIPP) opened on March 26, 1999, becoming the nation's first deep geologic repository for the permanent disposal of defense-generated transuranic (TRU) waste. This waste is currently retrievably stored at 27 sites across the country (see Figure 1, Section 1.0). From the WIPP's opening through the inventory date (September 30, 2002), 1,255 shipments of TRU waste were safely characterized, transported, and disposed in the WIPP.

DOE complex-wide TRU waste inventory information has been collected, analyzed, and published in several reports. The WIPP Transuranic Waste Baseline Inventory Report (WTWBIR), Revision 0, published in June 1994 (DOE 1994), was the first attempt made by the DOE complex to report all of its TRU waste at the waste-stream level. The TRU waste data reported in Revision 0 were considered preliminary until the DOE TRU waste sites completed quality checks of the data. Data changes resulting from the quality checks were contained in the WTWBIR, Revision 1, (DOE 1995a). Transuranic Waste Baseline Inventory Report (TWBIR) Revisions 2 and 3 (DOE 1995b and DOE 1996a) were published in 1995 and 1996 to include WIPP and non-WIPP wastes and other additional waste stream characteristic information. Data from Revision 2 and 3 supplemental information provided the inventory that Sandia National Laboratories (SNL) used to perform the necessary calculations for the Performance Assessment (PA) for the initial certification of the WIPP [Compliance Certification Application (CCA)] (DOE 1996b). To effectively keep track of the changes in the TRU waste inventory, site inventory information will be monitored for changes.

The WIPP Land Withdrawal Act (LWA) (Public Law No. 102-579, 110 Stat.2422, [1992], as amended by 104-201 [1996]) required that the U.S. Environmental Protection Agency (EPA) certify the WIPP site every five years after the first receipt of TRU waste. The first recertification application (the Compliance Recertification Application, referred to hereafter as the CRA-2004) was submitted to the EPA on March 26, 2004. The CRA-2004 included the inventory data collected in 2003 to support the waste estimate that would fill the repository for the Performance Assessment (PA). Subsequently, this document is a revision of Attachment F found in Appendix DATA of the CRA-2004 (DOE 1996b) and the Performance Assessment Baseline Calculation (PABC) (Leigh et al. 2005a; Leigh et al. 2005b) and will be referred to as the Transuranic Waste Baseline Inventory Report – 2004 (TWBIR-2004) throughout this document. The TWBIR-2004 primarily focuses on inventory information needed for the PA for the CRA-2004 and PABC and has been revised to include changes to the Hanford and Idaho National Engineering and Environmental Laboratory (INEEL), now the Idaho National Laboratory (INL) data as described in more detail below. The information in this report summarizes the DOE's TRU waste inventory, projections, and characteristics; reports emplaced waste; and is an update to the previously published TRU waste inventory that was used for the CRA-2004 PA. This update is also known as the PABC inventory. The TWBIR-2004 includes estimates for: 1) waste volumes (stored, projected, and emplaced); 2) radionuclides; 3) the 12 waste material parameters; 4) complexing agents; 5) oxyanions; 6) cement; 7) pyrochemical salts; and 8) the materials used to emplace the waste in the WIPP.

The primary differences between previous inventory data submittals (TWBIR Revisions 2 and 3) and the TWBIR-2004 are:

• This report accounts for the INEEL Advanced Mixed Waste Treatment Facility process by which 55-gallon drums are compacted and placed into 100-gallon drums, and disregards those calculations related to the proposed waste incineration process that was described in the TWBIR

Revision 3 (DOE 1996a). The Advanced Mixed Waste Treatment Facility is planning to do supercompaction rather than incineration.

- In addition, INEEL inventory has been revised to include buried waste identified for WIPP shipment that was originally reported in waste stream IN-Z001. This waste has been reported under four waste stream designations: IN-ICP-002, IN-ICP-003, IN-ICP-004, and IN-ICP-005. IN-Z001 still identifies the unknown portion of the waste stream.
- This report includes approximately 8,400 m<sup>3</sup> (296,688 ft<sup>3</sup>) of stored Hanford tank waste that was added to the inventory in December 2002.
- This report accounts for the site-requested deletion of several waste streams from Hanford Richland Operations inventory after the original CRA-2004 submittal.
- This report also addresses the waste that has been emplaced since the WIPP opened in 1999.

Finally, this report includes updates to site TRU Waste Baseline Inventory Waste Profiles (Waste Profiles) that were reported in TWBIR Revision 2 (DOE 1995b). The TRU waste sites provided updated Waste Profiles, which contain parameters that are important to the PA. The updated Waste Profiles for non-WIPP, WIPP, and emplaced waste streams are given in Appendices I, J, and K, respectively. The information contained in these profiles is considered the best estimate as of the inventory date, September 30, 2002, because more TRU waste characterization data are now available. The TRU Waste Baseline Inventory Waste Profile forms reflect the data as reported by the TRU waste sites. Some information that the sites have provided may have been changed to accommodate assumptions that are used in PA (for example, expansion of reported waste volumes for waste streams containing over-packed containers). In addition, the radionuclides have been decayed to a common time frame. References to the methodologies used for these adjustments are provided by Electronic Record Management System (ERMS) numbers in Appendix M of this document.

A comprehensive reference to the TWBIR-2004, entitled the *Transuranic Waste Inventory Update Report 2003*, *Computational Methodology* (LANL 2003), provides descriptions of the computations used to produce the inventory information that was used by SNL in the CRA-2004 and the PABC. Correction methodologies were used to analyze data provided by the sites, to correct inconsistencies, and to estimate waste material parameter densities and radionuclide activities where these data were not provided.

The following tables summarize the main aspects from the body of the text of the *Transuranic Waste Baseline Inventory Report-2004:* 

- Table ES-1. WIPP Contact-Handled TRU (CH-TRU) Waste Material Parameter Disposal Inventory
- Table ES-2. WIPP Remote-Handled TRU (RH-TRU) Waste Material Parameter Disposal Inventory
- Table ES-3. WIPP CH-TRU Waste Anticipated Inventory by Site
- Table ES-4. WIPP RH-TRU Waste Anticipated Inventory by Site
- Table ES-5. WIPP Summary Radionuclide Inventory

Table ES-1. WIPP CH-TRU Waste Material Parameter Disposal Inventory

| Waste Material Parameters    | Average Density (Kg/m3) |
|------------------------------|-------------------------|
| Iron-Base Metal/Alloys       | 1.1E+02                 |
| Aluminum-Base Metal/Alloys   | 1.4E+01                 |
| Other Metal/Alloys           | 3.2E+01                 |
| Other Inorganic Materials    | 4.0E+01                 |
| Cellulosics                  | 6.0E+01                 |
| Rubber                       | 1.3E+01                 |
| Plastics                     | 4.3E+01                 |
| Solidified, Inorganic Matrix | 1.1E+02                 |
| Cement (Solidified)          | 3.9E+01                 |
| Vitrified                    | 5.8E+00                 |
| Solidified, Organic Matrix   | 3.3E+01                 |
| Soils                        | 1.1E+02                 |
| Container Materials          |                         |
| Steel                        | 1.7E+02                 |
| Plastic                      | 1.7E+01                 |
| Lead                         | 1.3E-02                 |

Table ES-2. WIPP RH-TRU Waste Material Parameter Disposal Inventory

| Waste Material Parameters    | Average Density (Kg/m3) |
|------------------------------|-------------------------|
| Iron-Base Metal/Alloys       | 5.9E+01                 |
| Aluminum-Base Metal/Alloys   | 5.0E+00                 |
| Other Metal/Alloys           | 5.7E+01                 |
| Other Inorganic Materials    | 1.6E+01                 |
| Cellulosics                  | 9.3E+00                 |
| Rubber                       | 6.7E+00                 |
| Plastics                     | 8.0E+00                 |
| Solidified, Inorganic Matrix | 6.2E+01                 |
| Cement (Solidified)          | 1.9E+00                 |
| Vitrified                    | 1.2E-01                 |
| Solidified, Organic Matrix   | 8.3E-01                 |
| Soils                        | 5.0E+01                 |
| Container Materials          |                         |
| Steel                        | 5.4E+02                 |
| Plastic                      | 3.1E+00                 |
| Lead                         | 4.2E+02                 |

<sup>&</sup>lt;sup>1</sup> Summary shows the ten radionuclides with the highest concentration in curies per cubic meter for both CH-TRU and RH-TRU waste. The list includes twelve radionuclides because the ten radionuclides with the highest concentration are different for CH-TRU and RH-TRU waste.

<sup>&</sup>lt;sup>2</sup> Decayed through December 31, 2001.

# A-1.0 PYROCHEMICAL SALTS

A list of waste streams that contain pyrochemical salts was requested for the Performance Assessment Baseline Calculations (PABC) (Leigh et al. 2005a; Leigh et. al. 2005b) in support of the Compliance Recertification Application (CRA) (Giambalvo 2002). These waste streams were reported in a letter (Crawford 2003). Pyrochemical salt-containing waste streams were reported by LANL, LLNL, and RFETS and are shown in Table A-1.

### **B-1.0 VOLUME ESTIMATES**

# **B-1.1 Waste Inventory Volume Comparison**

This explanation applies to Tables B.1-1 through B.1-3. Tables B.1-1 and B.1-2 contain the volume comparisons for contact-handled (CH-) and remote-handled (RH-) TRU waste, respectively. Table B.1-3 contains the volume comparisons for the total CH-TRU, total RH-TRU, and emplaced waste. The current volume estimates for the Transuranic Waste Baseline Inventory Report - 2004 (TWBIR - 2004) are stored in the Transuranic Waste Baseline Inventory Database Revision 2.1 (TWBID Revision 2.1) (LANL 2005). The previous volume estimates are from the Transuranic Waste Baseline Inventory Report, Revision 2 (TWBIR Revision 2) (DOE 1995). The site name is given in the first column of Table B.1-1. Volume estimates for the TWBIR - 2004, the TWBIR Revision 2 (DOE 1995), and for the difference between the TWBIR - 2004 and TWBIR Revision 2 (DOE 1995) stored volumes for each site are given in the next three columns, respectively (columns 2, 3, and 4). Volume estimates for the TWBIR -2004, TWBIR Revision 2, and for the difference between the TWBIR - 2004 and TWBIR Revision 2 projected volumes for each site are given in columns 5, 6, and 7, respectively. Finally, volume estimates for the TWBIR - 2004, TWBIR Revision 2, and for the difference between the TWBIR - 2004 and TWBIR Revision 2 anticipated volumes for each site are given in the last three columns, respectively (columns 8, 9, and 10). The total volumes for columns 2-10 are then given near the bottom of Table B.1-1.

Table B.1-2 is similar to Table B.1-1 except that it contains the comparison of stored (columns 2–4), projected (columns 5–7), and anticipated (columns 8–10) RH-TRU waste volumes by site (column 1) and gives the total volumes of RH-TRU waste. There was no RH-TRU waste emplaced as of the inventory date, September 30, 2002.

The TWBIR Revision 2 (DOE 1995) reported total CH and RH-TRU waste volume was 1.4E+05 m<sup>3</sup>. This is an increase of 2.0E+04 m<sup>3</sup> total volume of TRU waste estimated by TWBIR - 2004. The TWBIR - 2004 and TWBIR Revision 2 (DOE 1995) inventory information in Tables B.1-1 through B.1-3 were analyzed for differences in stored, projected, and anticipated volumes. The CH-TRU waste volume information will be discussed first (Section B-1.3), followed by a discussion of the RH-TRU waste volume information (Section B-1.5).

Table B.1-3 has the same column structure as Tables B.1-1 and B.1-2, but contains the total volumes for the comparison of stored, projected, and anticipated CH- and RH-TRU waste volumes and provides the total waste volume. The emplaced CH-TRU waste volume, 7.7E+03 m<sup>3</sup>, is added to the anticipated volumes for a current total TRU waste volume of 1.6E+05 m<sup>3</sup>.

Appendix B - 1 -

Table B.1-1. Comparison of Stored, Projected, and Anticipated CH-TRU Waste Volumes Between the TWBIR - 2004 and TWBIR Revision 2 (DOE 1995) (m<sup>3</sup>)<sup>1</sup>

Appendix B - 4 -

<sup>&</sup>lt;sup>2</sup>Some numbers represented on this table have been rounded in the TWBID Revision 2.1 (LANL 2005) database prior to reporting.

## **B-1.2** Waste Inventory Comparison by Final Waste Form

Tables B.1-4 through B.1-23 contain two parts, the top portion of each table shows the volume estimates, and the lower portion of each table shows the waste material parameter (WMP) estimates. These tables compare the TWBIR - 2004 and TWBIR Revision 2 (DOE 1995) volumes and WMPs for the roll-ups by final waste form. There is one table for each final waste form for each CH- and RH-TRU waste type.

The first part of Tables B.1-4 through B.1-23 contains rolled-up final waste form volume estimates by site, and was compiled using the TWBID Revision 2.1 (LANL 2005). In the upper portion of each table, there are nine columns if waste of that final form has been emplaced, and eight columns if no waste of that final form has emplaced. The first column contains the site identification. Column 2 contains the volume of emplaced waste, if any, for the sites listed. Columns 3 and 4 contain the TWBIR - 2004 and TWBIR Revision 2 (DOE 1995) stored volumes, respectively. Columns 5 and 6 contain the TWBIR - 2004 and TWBIR Revision 2 projected volumes, respectively. Columns 7 and 8 contain the TWBIR - 2004 and TWBIR Revision 2 total volumes, respectively. The 8th or 9th and last column, depending on whether or not there is any emplaced waste of that final form, contain the volume difference between the total (anticipated) TWBIR - 2004 and TWBIR Revision 2 volumes (columns 7 and 8, respectively). This volume difference is the result of subtracting TWBIR Revision 2 volumes from TWBIR - 2004 volumes. The sum of each column is shown in the "TRU Waste Site Total" row.

TWBIR - 2004 and TWBIR Revision 2 (DOE 1995) stored and projected waste volumes by site that contributed to the final waste form are given for the applicable sites and for emplaced waste. No waste was emplaced at the time of the TWBIR Revision 2. Sections B-1.4 and B-1.6 explain the volume information in these tables.

The second part of Tables B.1-4 through B.1-23 contains the WMP densities in units of kilograms per cubic meter (kg/m³) and shows the comparison of TWBIR - 2004 and TWBIR Revision 2 (DOE 1995) WMPs for the roll-ups by final waste form. The last column of the WMP table gives the difference between TWBIR Revision 2 density from the TWBIR - 2004 density. TWBIR - 2004 WMP estimates were compiled using TWBID Revision 2.1 (LANL 2005). Sections B-2.1 and B-2.2 explain the WMP estimates in these tables. Section B-2.3 discusses the waste container (packaging) materials.

### **B-1.3** Analysis of CH-TRU Waste Volume Differences by Site

Table B.1-1 compares the stored, projected, and anticipated CH-TRU waste volumes between the TWBIR Revision 2 (DOE 1995) and TWBIR - 2004 inventory estimates by site. Table B.1-3 gives the total CH-TRU waste, RH-TRU waste, and emplaced waste volumes.

The total difference (excludes emplaced waste) in stored CH-TRU waste at the sites is 5.1E+04 m³, or an 89.7 percent increase from the TWBIR Revision 2 (DOE 1995) inventory. The bulk of this additional stored volume came from the Idaho National Laboratory (INL), 3.2E+04 m³; the Savannah River Site (SRS), 1.0E+04 m³; Hanford Office of River Protection (Hanford RP) 3.9E+03 m³; Hanford Richland Operations (Richland RL), 1.0E+03 m³; Los Alamos National

Laboratory (LANL), 1.0E+03 m<sup>3</sup>; and the Rocky Flats Environmental Technology Site (RFETS) 4.6E+03 m<sup>3</sup>. The sites adjusted their existing inventory data based on new information (since the TWBIR Revision 2 inventory) about the waste and/or increased accessibility to the waste. The Hanford River Protection (RP) stored waste (3.9E+03 m<sup>3</sup>) was recently added to the inventory. Several small-quantity generator sites have also added small volumes of CH-TRU stored waste to the inventory that were not previously reported (Battelle Columbus Laboratories (BCL), Bettis Atomic Power Laboratory (BAPL), Knolls Atomic Power Laboratory Nuclear Fuels Services (KAPL-NFS), and Paducah Gaseous Diffusion Plant (PGDP)).

The total projected CH-TRU waste volume has decreased by 1.9E+04 m³, or a 35 percent decrease from the TWBIR Revision 2 (DOE 1995) inventory. The largest decrease in projected CH-TRU waste volume is 2.7E+04 m³ reported by Hanford RL. Changes in future forecast planning volumes based on better knowledge about the waste, on-site burial of non-TRU waste, or re-designation into the stored waste category as a result of waste operations resulted in this decrease.

The anticipated CH-TRU waste is simply the sum of the stored and projected wastes. It follows that the overall change is an increase of 3.1E+04 m<sup>3</sup>, or nearly a 27 percent increase for the anticipated volumes.

The emplaced CH-TRU waste volume as of the inventory date (September 30, 2002) is 7.7E+03 m<sup>3</sup>. As of the inventory date, only CH-TRU waste has been emplaced. Table B.1-3 shows the sum of the stored, projected, anticipated, and emplaced CH-TRU waste volumes as 1.5E+05 m<sup>3</sup>. The total CH-TRU waste volume from the TWBIR Revision 2 (DOE 1995) was 1.1E+05 m<sup>3</sup>, giving a difference of 3.9E+04 m<sup>3</sup>.

# **B-1.4** CH-TRU Waste Volumes by Final Waste Form by Site

Tables B.1-4 through B.1-14 indicates that 6 of the 11 CH-TRU wastes final waste form total volumes increased (filter material, graphite, heterogeneous debris, inorganic non-metal, solidified inorganic material, and solidified organic material). Of these, the heterogeneous debris and solidified inorganic material volumes had the largest increases of 2.2E+04 m³ and 3.4E+04 m³, respectively. The solidified organic material increased by 4.3E+03 m³ and the inorganic non-metal increased by 7.7E+03 m³. The filter material and final waste form volumes increased by 1.3E+03 m³. The graphite material increased by 4.3E+02 m³.

Five of the 11 CH-TRU waste final waste form total volumes decreased (combustible material, graphite, lead/cadmium metal, salt, soil, and uncategorized metal). These decreases ranged from less than 1,9E+02 m³ for lead/cadmium metal, and 1.4E+01 for salt, to 4.2E+03 m³ for combustible material and 2.7E+04 m³ for uncategorized metal.

<sup>1</sup> See pages 28 and 29 for discussion.

Appendix B - 26 -

<sup>2</sup> Some numbers represented on this table have been rounded in the TWBID Revision 2.1 (LANL 2005) database prior to reporting.

The increased volume (1.4E+04 m<sup>3</sup>) of heterogeneous debris from INL was due to the anticipated start-up of the Advanced Mixed Waste Treatment Facility (AMWTF) and the inclusion of INL pre-1970 waste streams. For the AMWTF, INL combined many waste streams into one new waste stream called IN-BN-510. The final waste form of this waste stream is heterogeneous debris. At the time of the PABC, it was assumed this waste stream would be compacted so that an average of four 55-gallon drums will fit into one 100-gallon drum. A large volume (6.9E+03 m<sup>3</sup>) of heterogeneous debris waste from SRS originates from the "FB" and "HB" process lines (CCP 2003a, 2003b, 2003c, and 2003d). The LANL waste streams that contribute to the increased heterogeneous debris waste volume (3.5E+03 m<sup>3</sup>) originate primarily from waste generated during facility and equipment operations and maintenance. RFETS added heterogeneous debris waste (2.2E+03 m<sup>3</sup>) consisting of construction rubble, blacktop, concrete, dirt, and sand due primarily to decontamination and decommissioning operations. The remaining sites listed in Table B.1-7 with positive overall changes contributed additional volumes of less than 5.0E+02 m<sup>3</sup> each. The emplaced volume for heterogeneous debris was 5.7E+02 m<sup>3</sup> as of the inventory date. The sites that subtracted significant heterogeneous debris volumes are Hanford RL, with a decrease of 4.0E+03 m<sup>3</sup>, and Oak Ridge National Laboratory (ORNL), with a decrease of 1.1E+03 m<sup>3</sup>.

The overall increase in volume for solidified inorganic material is 3.4E+04 m³. Some sites added volume and some removed volume (see Table B.1-12). The sites that added solidified inorganic material volume are INL (3.4E+04 m³) and Hanford RP (3.9E+03 m³). The increased volume of solidified inorganic material from INL is due primarily to solidified sludges from treatment plants and other processes, such as ion exchange and the addition of the pre-1970 waste streams. The increased volume of solidified inorganic material from Hanford RP is due to the inclusion of tank sludges to the inventory. The sites that removed significant solidified inorganics volume are LANL (2.2E+03 m³) and SRS (1.4E+03 m³). The emplaced volume for this solidified inorganic material was 3.3E+03 m³ as of the inventory date, September 30, 2002.

The overall increase in volume for solidified organic material is 4.3E+03 m<sup>3</sup>. INL added significant solidified organic material volume, with 3.9E+03 m<sup>3</sup> (see Table B.1-13). This increased volume is primarily due to the inclusion of the pre-1970 waste streams. There was no emplaced volume for solidified organic material as of the inventory date, September 30, 2002.

The overall increase in volume for inorganic non-metal is 7.7E+03 m<sup>3</sup>. The site that added significant inorganic non-metal volume is INL, with 8.0E+03 m<sup>3</sup> (see Table B.1-8). The emplaced volume for inorganic non-metal was 9.7E+02 m<sup>3</sup> as of the inventory date, September 30, 2002.

The overall increase in volume for filter material is  $1.3E+03~\text{m}^3$ . The site adding significant filter material volume is LLNL, with  $5.9E+02~\text{m}^3$  (see Table B.1-5). The emplaced volume for filter material was  $3.4E+02~\text{m}^3$  as of the inventory date, September 30, 2002.

The overall decrease in volume for salt waste is 1.4E+01 m<sup>3</sup>. RFETS removed significant salt waste volume, with 3.1E+02 m<sup>3</sup> (see Table B.1-10) from the site. The emplaced volume for salt waste was 1.5E+03 m<sup>3</sup> as of the inventory date, September 30, 2002.

The overall decrease in volume for uncategorized metal is 2.7E+04 m<sup>3</sup>. The sites that removed significant uncategorized metal volume were Hanford RL with 1.6E+04 m<sup>3</sup>, LANL with 5.6E+03 m<sup>3</sup>, and INL with 5.9E+03 m<sup>3</sup> (see Table B.1-14). The emplaced volume for uncategorized metal was 3.6E+02 m<sup>3</sup> as of the inventory date, September 30, 2002.

The overall decrease in volume for combustible material is 4.2E+03 m<sup>3</sup>. The sites that removed significant volume were Hanford RL with 1.6E+03 m<sup>3</sup>, and INL with 3.3E+03 m<sup>3</sup> (see Table B.1-4). The emplaced volume for combustible material was 6.1E+02 m<sup>3</sup> as of the inventory date, September 30, 2002.

# **B-1.5** Analysis of RH-TRU Waste Volume Differences by Site

Table B.1-2 compares the stored, projected, and anticipated RH-TRU waste volumes between the TWBIR - 2004 and TWBIR Revision 2 (DOE 1995) inventories by site and gives the total RH-TRU waste volumes.

The total difference in stored RH-TRU waste at the sites is 1.7E+03 m³, or about a 47 percent increase from the TWBIR Revision 2 (DOE 1995) inventory. The bulk of this additional stored volume came from Hanford RP (4.5E+03 m³), Knolls Atomic Power Laboratory (KAPL) (1.4E+02 m³), and Argonne National Laboratory-East (ANL-E) (1.2E+02 m³). As with CH-TRU waste, the sites adjusted their existing inventory data for RH-TRU waste volumes based on new information [since the TWBIR Revision 2 (DOE 1995) inventory] about the waste and/or increased accessibility to the waste. The Hanford RP waste was recently added to the inventory. Argonne National Laboratory - East, (ANL-E), BAPL, and Sandia National Laboratories (SNL) have added small volumes of stored RH-TRU waste to the inventory that were not previously reported. ORNL transferred all RH-TRU waste stored volume to projected waste volume because they plan to process the waste using segregation, compaction, size reduction, and evaporative drying for sludge (see Appendix C).

The total projected RH-TRU waste volume has decreased by 2.2E+04 m<sup>3</sup>, or about a 92 percent decrease from the TWBIR Revision 2 (DOE 1995) inventory. The largest decrease in projected RH-TRU waste volume is 2.1E+04 m<sup>3</sup> reported by Hanford RL. This change is based on the site gaining better knowledge of the waste streams and thus managing the waste differently.

The anticipated RH-TRU waste is simply the sum of the stored and projected wastes. It follows that the overall change is a decrease of 2.0E+04 m<sup>3</sup>, or a 74 percent decrease for the anticipated volumes. There was no emplaced waste volume as of the inventory date, September 30, 2002.

#### **B-1.6** RH-TRU Waste Volumes by Final Waste Form by Site

Five of the nine RH-TRU waste final waste form total volumes increased (filter material, inorganic non-metal, soil, solidified inorganic material, and solidified organic material). Of these, the solidified inorganic material volume had the largest increase of 3.6E+03 m<sup>3</sup>. The filter material, soil, and solidified organic material increased by 2.0E+02 m<sup>3</sup> or less.

Four of the nine RH-TRU final waste form total volumes decreased (heterogeneous debris, combustible material, lead/cadmium metal, and uncategorized metal). These decreases ranged

from 6.6E+01 m<sup>3</sup> or less for combustible material and lead/cadmium metal to 1.7E+04 m<sup>3</sup> for uncategorized metal.

The overall increase in volume for RH-TRU waste solidified inorganic material is 3.6E+03 m<sup>3</sup>. Some sites added volume and some removed volume (see Table B.1-21). The sites that added significant volume were Hanford RP (4.5E+03 m<sup>3</sup>) and Hanford RL (1.3E+02 m<sup>3</sup>). The site that decreased significantly in volume was ORNL (1.0E+03 m<sup>3</sup>).

The overall decrease in volume for RH-TRU waste uncategorized metal is  $1.7E+04~\text{m}^3$ . The site that removed significant uncategorized metal volume is Hanford RL with  $1.6E+04~\text{m}^3$  (see Table B.1-23). The decreased volume from Hanford RL is primarily due to reassignment of the waste to more appropriate final waste forms based on new characterization information.

# B-2.0 WASTE MATERIAL PARAMETERS AND CONTAINER MATERIALS ESTIMATES

Tables B.1-24 and B.1-25 compare WMP densities for the WIPP roll-ups from the TWBIR Revision 2 (DOE 1995) with the TWBIR - 2004 WMP densities from TWBID Revision 2.1 (LANL 2005) for CH-TRU and RH-TRU waste, respectively. These tables also show, in the last column, the difference between TWBIR Revision 2 WMP densities from the TWBIR - 2004 WMP densities. These tables, unlike Tables B.1-4 through B.1-23, contain the rolled-up values for the container (also referred to as packaging) materials. One of the container materials given in Table B.1-25 is "Steel Plug." "N/A," indicating "not applicable," has been entered for the TWBIR - 2004 container material value and the difference value. The steel plugs are added by WIPP Waste Handling Operations (WHO) at the WIPP facility and are addressed in Section 3.5 of the report.

A detailed comparison of the TWBIR - 2004 and TWBIR Revision 2 (DOE 1995) volume estimates is provided in Section B-1.0. However, because volume is a factor in the comparison of TWBIR - 2004 and TWBIR Revision 2 (DOE 1995) WMP densities, it is also considered here.

The TWBIR - 2004 and TWBIR Revision 2 (DOE 1995) information in Tables B.1-4 through B.1-25 was analyzed for differences in volume and WMP densities, as applicable. The volume estimates for each final waste form for CH-TRU waste (Table B.1-4 through Table B.1-14) and the volume estimates for each final waste form for RH-TRU waste (from Table B.1-15 through Table B.1-23) are discussed in Section B.1.0. The WMP estimates for each final waste form and for the WIPP roll-up (Table B.1-24 and Table B.1-25) are discussed here. Finally, the differences in the waste container material densities are addressed.

The iron-based metal/alloys, cellulosic, rubber, and plastic (CPR) materials, and cement (solidified) WMPs impact gas generation within the WIPP. The EPA Compliance Certification Decision (EPA 1998) therefore sets limits for these WMPs. The collective limit for CPR materials in the WIPP is dependent upon emplaced inventory. The limits are discussed in CRA-2004 (DOE 2004), Chapter 4, Table 4-11. Because of the maximum limit on the CPR materials, particular attention is paid to the increases in these WMPs. The total CPR materials density for

the TWBIR Revision 2 (DOE 1995) inventory was 98 kg/m³ (see Table B.1-24) and the TWBIR - 2004 total is 116 kg/m³ (see Table B.1-24). It is therefore important to understand the basis of these increases. These are discussed in Section B.2.1 for CH-TRU waste and in Section B.2.2 for RH-TRU waste.

The repository limit for the ferrous metals is 2.0E+07 (20 million) kg, and 2.0E+03 (2 thousand) kg for nonferrous metals. According to the Contact Handled Transuranic Waste Acceptance Criteria for the Waste Isolation Pilot Plant (DOE 2004), these minimum limits are met in the total repository inventory by the metals that constitute the payload containers. Container materials are discussed in Sections B.2.3 and B.2.4.

## **B-2.1** Analysis of CH-TRU Waste Material Parameter Differences

Analysis of the twelve WMPs in the TWBIR Revision 2 (DOE 1995) and TWBIR - 2004 for CH-TRU waste shows that seven of the WMP densities increased, and five of them decreased in density (see Table B.1-24). Decreases were noted in iron-based metal/alloys, aluminum-based metal/alloys, other metal/alloys, cement (solidified), and vitrified material. The densities of the other inorganic materials, CPR materials, solidified inorganic material, soils, and solidified organic material all increased.

Of particular interest are the increases in the densities of CPR materials of  $6.0 \text{ kg/m}^3$  for cellulosic material,  $9.0 \text{ kg/m}^3$  for plastic material, and  $3.0 \text{ kg/m}^3$  for rubber material. An analysis of the CPR materials for CH TRU waste in the roll-ups by final waste form (Tables B.1-4 through B.1-14) show that there are increases in the densities of CPR materials for soil ( $15 \text{ kg/m}^3$  cellulose), solidified organics ( $110 \text{ kg/m}^3$  plastic) and heterogeneous debris (34, 13, and  $11 \text{ kg/m}^3$ , cellulose, plastic and rubber, respectively). In addition, the density of plastic material increased by  $10.0 \text{ kg/m}^3$  for filter material. Finally, the density of cellulosic material increased by  $81 \text{ kg/m}^3$  and the density of plastic material increased by  $17 \text{ kg/m}^3$  for graphite. There are other increases in the densities of the CPR materials, but these increases are all less than  $10 \text{ kg/m}^3$ , and will not be specifically addressed here.

Heterogeneous debris had the largest increases in the CPR materials densities. The primary cause of these increases is the combined waste stream at the INL, IN-BN-510, Supercompacted Debris Waste. The densities for the CPR materials WMPs are 303, 205, and 80 kg/m³, respectively, for this waste stream (LANL 2005). The densities of CPR materials are high because of the nature of the treatment of this waste stream, and because INL combined approximately 200 heterogeneous debris waste streams to produce this single waste stream (see the waste stream crosswalk in Appendix C). The INL is treating the waste at the AMWTF and has the capability of supercompacting 55-gallon drums containing CH-TRU waste. The compacted drums are then placed in one 100-gallon drum for shipment to the WIPP.

Solidified organic and graphite final waste forms had the next largest increases in cellulosic and plastic material densities. The largest contributors to solidified organic disposition are INL and RFETS. The only contributions to graphite came from RFETS in the TWBIR - 2004.

Table B.1-24. Differences in Waste Material Parameter Densities (kg/m³) for CH-TRU Waste Between TWBIR - 2004 and TWBIR Revision 2<sup>1</sup>

| Waste Material Parameters     | TWBIR - 2004<br>(kg/m³) | TWBIR Rev. 2 (kg/m³) | Difference (kg/m³)² |
|-------------------------------|-------------------------|----------------------|---------------------|
| Iron-Based Metal/Alloys       | 1.1E+02                 | 1.7E+02              | -6.0E+01            |
| Aluminum-Based Metal/Alloys   | 1.4E+01                 | 1.8E+01              | -4.0E+00            |
| Other Metal/Alloys            | 3.2E+01                 | 6.7E+01              | -3.5E+01            |
| Other Inorganic Material      | 4.0E+01                 | 3.1E+01              | 9.0E+00             |
| Cellulosic Material           | 6.0E+01                 | 5.4E+01              | 6.0E+00             |
| Rubber Material               | 1.3E+01                 | 1.0E+01              | 3.0E+00             |
| Plastic Material              | 4.3E+01                 | 3.4E+01              | 9.0E+00             |
| Solidified Inorganic Material | 1.1E+02                 | 5.4E+01              | 5.6E+01             |
| Cement (Solidified)           | 3.9E+01                 | 5.0E+01              | -1.1E+01            |
| Vitrified                     | 5.8E+00                 | 5.5E+01              | -4.9E+01            |
| Solidified Organic Material   | 3.3E+01                 | 5.6E+00              | 2.7E+01             |
| Soil                          | 1.1E+02                 | 4.4E+01              | 6.6E+01             |
|                               |                         |                      |                     |
| Container Materials           |                         |                      |                     |
| Steel                         | 1.7E+02                 | 1.4E+02              | 2.9E+01             |
| Plastic                       | 1.7E+01                 | 2.6E+01              | -9.0E+00            |
| Lead                          | 1.3E-02                 | N/A                  | N/A                 |

<sup>1</sup> See pages 29 and 30 for discussion.

### **B-2.2** Analysis of RH-TRU Waste Material Parameter Differences

Analysis of the 12 WMPs in the TWBIR Revision 2 (DOE 1995) and TWBIR - 2004 RH-TRU waste show that 9 of 12 WMPs decreased in density (see Table B.1-25). Decreases were noted in the iron-based metal/alloys, aluminum-based metal/alloys, other metal/alloys, other inorganic materials, cellulosic and plastic materials, cement (solidified), vitrified, and solidified organic material. The densities of the rubber material, solidified inorganic material, and soil increased.

Although the densities of RH-TRU waste cellulosic and plastic materials decreased overall (Table B.1-25), an analysis of the CPR materials in the roll-ups by final waste form (Tables B.1-15 through B.1-23) show that there are increases in the densities of cellulosic and plastic materials in some of the final waste forms. The densities of cellulosic material increased in the filter material and solidified organic material (by 73 and 20 kg/m³, respectively). There is an increase in the rubber material for filter material (19 kg/m³).

<sup>2</sup> Some numbers represented on this table have been rounded in the TWBID Revision 2.1 (LANL 2005) database prior to reporting.

Table B.1-25. Difference on Waste Material Parameter Densities (kg/m³) for RH-TRU Waste Between TWBIR - 2004 and TWBIR Revision 2<sup>1</sup>

| Waste Material Parameters     | TWBIR - 2004<br>(kg/m <sup>3</sup> ) | TWBIR Rev. 2 (kg/m³) | Difference (kg/m³)² |
|-------------------------------|--------------------------------------|----------------------|---------------------|
| Iron-Base Metal/Alloys        | 5.9E+01                              | 1.0E+02              | -4.1E+01            |
| Aluminum-Based Metal/Alloys   | 5.0E+00                              | 7.1E+00              | -2.1E+00            |
| Other Metal/Alloys            | 5.7E+01                              | 2.5E+02              | -1.9E+02            |

<sup>1</sup> See pages 31 and 32 for discussion.

Finally, the density of plastic increased in the combustible material, inorganic non-metal, and solidified organic material (by 85, 20, and  $13 \text{ kg/m}^3$ , respectively). The remaining increases in the densities of the CPR materials are less than  $10 \text{ kg/m}^3$  each.

# **B-2.3** Analysis of CH-TRU Waste Container Materials

The container materials for CH-TRU waste are steel, plastic, and lead. Table B.1-24 indicates that the density of steel increased from  $140 \text{ kg/m}^3$  to  $170 \text{ kg/m}^3$ , and the density of plastic decreased from  $26 \text{ kg/m}^3$  to  $17 \text{ kg/m}^3$ .

Two significant changes in the inventory contributed to the increase in the density of steel container materials. First, a review of the TWBIR Revision 2 database (DOE 1995) reveals that the sites did not intend to use pipe over-pack components (POCs) at that time, and hence none were reported in the database. The supporting database for the TWBIR - 2004, the TWBID Revision 2.1 (LANL 2005), indicates that LANL, RFETS, and Hanford RL will use the POCs. In fact, RFETS has shipped waste from seven waste streams using POCs, and these are now emplaced in the WIPP. The difference in the density of steel between the 55-gallon drum (131 kg/m³ [see Table 27 of the main body of this report]) and the RH-TRU waste container POCs (525 kg/m³, as reported by RFETS) is approximately 394 kg/m³. There are currently 56 waste streams for which the sites have indicated POCs will be used. These are shown below in Table

Appendix B - 32 -

Some numbers represented on this table have been rounded in the TWBID Revision 2.1 (LANL 2005) database prior to reporting.

B.1-26, along with seven waste streams that were emplaced in the WIPP as of the inventory date, September 30, 2002.

Second, the INL super-compacted debris waste stream (IN-BN-510) will have an average of four compacted 55-gallon drums in each 100-gallon drum. The steel comprising the 55-gallon drums falls into the iron-based metal/alloys WMP and the steel comprising the 100-gallon drums is steel container material for this waste stream. The typical value for a 55-gallon drum is 131 kg/m³, and the typical value for a 100-gallon drum is 114 kg/m³, as provided in Section 3.2.2 (see Table 27 of the main body of this report). The container/packaging materials for this waste stream are discussed in Appendix D, Section 3.3.1.

## **B-2.4** Analysis of RH-TRU Waste Container Materials

The RH-TRU waste container materials are steel, plastic, lead, and steel plug. The steel waste container material increased by 90 kg/m³. The plastic and lead waste container materials decreased (by approximately less than 1 and 50 kg/m³, respectively). The steel plug is actually supplied by the Waste Handling Operations group at the WIPP and is not reported by the sites in the current inventory, as it is not part of the shipped package. The density for the steel plug was, however, reported in the TWBIR Revision 2 (DOE 1995) inventory.

Table B.1-26. Waste Streams Shipped and to be Shipped in POCs to the WIPP

| Site  | Waste Stream | Site  | Waste Stream | Site       | Waste Stream |

#### **B-3.0 RADIONUCLIDE ESTIMATES**

A comparison of Table 3-1 from TWBIR Revision 3 (DOE 1996) (WIPP Disposal Radionuclide *Inventory for the CCA*) to the data reported in Section 3.3.3, Table 37 of the main body of this report (WIPP Disposal Radionuclide Inventory for the CRA) is contained in Table B.1-27 for CH-TRU waste and Table B.1-28 for RH-TRU waste. The radionuclide values from TWBIR Revision 3 were decayed through 1995 as the base year and have not been further decayed, but are reported as they were in Revision 3. The values for short-lived radionuclides would have decreased over the six-year interval if no change in the inventory occurred since the CCA. The values from TWBID Revision 2.1 (LANL 2005) are decayed through 2001 (December 31, 2001) as the base year. A review of the results for CH-TRU waste indicates that the overall activity for all radionuclides has decreased by nearly 25 percent. Four of the radionuclides with the five highest activity concentrations decreased in activity between 15 and 55 percent, while <sup>241</sup>Am increased in activity by 9.1 percent. The results for RH-TRU waste are not as consistent, with substantial variations in individual radionuclide activity, and an overall increase in activity of about 60 percent. Based on total curies, the five most abundant CH-TRU waste isotopes in the TWBIR Revision 3, <sup>241</sup>Am, <sup>238</sup>Pu, <sup>239</sup>Pu, <sup>240</sup>Pu, and <sup>241</sup>Pu, are the most abundant in the TWBIR -2004 (see bottom of Table B.1-27). For RH-TRU waste, the five most abundant isotopes in the TWBIR Revision 3, <sup>137m</sup>Ba, <sup>137</sup>Cs, <sup>241</sup>Pu, <sup>90</sup>Sr, and <sup>90</sup>Y, are still the most abundant in the TWBIR - 2004 report (see bottom of Table B.1-28).

#### C-1.0 INTRODUCTION

This Transuranic Waste Baseline Inventory Report - 2004 (TWBIR - 2004) contains the update to the Transuranic Waste Baseline Inventory Report, Revision 2 (TWBIR Revision 2) (DOE 1995) and TWBIR Revision 3 (DOE 1996). The U.S. Environmental Protection Agency (EPA) is interested in the differences in the inventory between TWBIR Revisions 2 and 3 and this TWBIR - 2004. The Compliance Certification Application (CCA) used the TWBIR Revisions 2 and 3 data for the Compliance Certification Decision (CRA) (EPA 1998) to initially certify the Waste Isolation Pilot Plant (WIPP). During their completeness review, the EPA requested that significant changes in inventory information that had occurred since the cut off date of September 30, 2002 be included in this updated document.

### Those changes include:

- The deletion of 11 waste streams from the Hanford Richland Operations Office (RL) (Lott 2004a)
- The inclusion of 4 waste streams at INL from the pre-1970 buried waste that was originally reported in waste stream IN-Z001 (Lott 2004b)
- Changes that resulted from a final review of the waste stream profiles. This review identified inconsistencies (such as accounting methods for packaging configurations, accounting for low-level waste (LLW) as Transuranic (TRU) waste, volume reductions processes, accounting for cement, packaging material densities, inconsistent WMPs, and final form radionuclide concentrations) which have now been corrected. As noted in the Leigh and Crawford (2004) summary report from this review, none of these inconsistencies had an impact on the performance assessment (PA) calculations that were reported in the CRA-2004 (DOE 2004)
- The waste streams from some small quantity sites that have shipped their waste to other sites or to WIPP have been deleted from this appendix, but the waste stream information is still included in the document

A crosswalk that maps current waste streams to those identified in TWBIR Revision 2 is provided in this appendix. Each TRU waste site was requested to provide an explanation as to what changed in their inventory since the CCA inventory. Those explanations are provided in the respective site sections. The inventory information in this appendix is not intended to match the inventory information submitted for use in the PA in support of the WIPP CRA-2004. The scope of this appendix is limited to revealing the significant changes in waste streams since September 30, 2002. New sites have been included in this update and in this appendix. The new sites are Framatome (FR), Hanford-River Protection (RP), General Electric Vallecitos Nuclear Center (GE), Separations Process Research Unit (SPRU), Babcock & Wilcox-Lynchburg (BL), and Knolls Atomic Power Laboratory-Nuclear Fuels Services (KN). Waste streams presented in this section include waste streams from both Appendix I (currently non-WIPP waste streams) and Appendix J (WIPP-bound waste streams).

More small quantity TRU waste sites have been added to the list of sites that no longer have TRU waste. The list of sites at the time of this report includes ARCO Medical Products (AM), Pantex (PX), Teledyne-Brown (TB), Ames Laboratory (AL), Mound (MD), Energy Technology Engineering Center (ETEC), University of Missouri Research Reactor (MURR), and Lawrence Berkeley National Laboratory (LBNL).

"N/A" in the TWBIR Revision 2 Waste Streams column in the following tables identifies new waste streams that were reported in TWBIR - 2004. "N/A" in the TWBIR - 2004 Waste Streams column identifies a deleted waste stream from TWBIR Revision 2. The data from Hanford RL includes several entries marked "unavailable." This entry resulted from the process used by the Hanford RL site that incorporated container re-assignments to new waste stream identification numbers without regard to waste stream continuity.

### C-1.1 Argonne National Laboratory-East (AE)

During the Argonne National Laboratory-East (ANL-E) 1996 data generation period for the TWBIR, the information submitted was the best available at the time. The ANL-E had a large number of bins [typically 3.5 m³ (123 ft³)¹ in size] that contained waste dating back to the late 1980s. These bins, containing various sized containers, were assigned a TRU waste designation by the generators based on the knowledge of the waste generation process. As a result, some of the waste may or may not have been TRU. There were also various-sized containers that contained liquids or solids that made it difficult to determine what the final waste stream volume would be.

Subsequent to the TWBIR Revision 2 submittal, ANL-E embarked on an aggressive campaign to characterize, treat, and where appropriate, repackage the TRU waste from the bins and containers identified and reported in the TWBIR Revision 2. Whenever possible, repackaging was performed that resulted in the waste being placed into 55-gallon drums for enhanced inventory identification and tracking, and also in preparation for eventual characterization and disposal. This repackaging process allowed ANL-E's to more accurately quantify the TRU waste.

In addition to improved inventory accountability through ANL-E repackaging efforts, there was an increase in the volume of TRU waste at ANL-E. Additionally, more TRU waste was generated since the TWBIR Revision 2 as a result of aggressive site-wide cleanup activities performed during the late 1990s. Table C-1 contains the crosswalk of the ANL-E waste streams from TWBIR Revision 2 to the TWBIR - 2004.

Table C-1. Argonne National Laboratory-East (AE) Crosswalk of Waste Streams
TWBIR Revision 2 vs. TWBIR - 2004

<sup>&</sup>lt;sup>1</sup> The conversion factor used throughout this section is 1 m<sup>3</sup> (35.32 ft<sup>3</sup>).

Appendix C

## C-1.2 Argonne National Laboratory-West (AW)

The increase in the TWBIR Revision 2 quantity of 26 m<sup>3</sup> (918 ft<sup>3</sup>) to the TWBIR - 2004 quantity of 306 m<sup>3</sup> (10,808 ft<sup>3</sup>) is caused by the inclusion of the waste volume that is suspect and may be TRU, with waste that is known to be TRU.

The 280 m<sup>3</sup> (9,890 ft<sup>3</sup>) of suspect TRU waste is difficult to characterize since it is typically mixed with highly radioactive waste and stored inside sealed steel in-ground silos at the ANL-W Radioactive Scrap and Waste facility. Many of the suspect TRU silos were loaded in the 1960s and 1970s and do not have detailed inventory records that call out TRU isotopes.

ANL-W has requested funding to design and build a remote-handled waste treatment facility to unload, sort, characterize, treat, and repackage the waste in these silos. Until this facility begins operation (scheduled in 2009), an upper bound, conservative estimate of the Argonne National Laboratory-West (ANL-W) TRU waste that could potentially go to WIPP for disposal will be used.

The ANL-W TRU waste volumes, 306 m<sup>3</sup> (10,808 ft<sup>3</sup>), is the TRU inventory figure that ANL-W reported to the Inspector General during the April 2002 survey of remote-handled TRU waste site activities.

Table C-2 contains the crosswalk of the ANL-W waste streams from the TWBIR Revision 2 to the TWBIR - 2004.

## C-1.3 Babcock and Wilcox-Lynchburg (BL)

The Babcock and Wilcox-Lynchburg (BL) TRU waste was discussed in TWBIR Revision 2, but no specific waste streams were included in the TRU waste inventory information. BL added one new waste stream for the TWBIR - 2004. Table C-3 provides the new waste stream identified by BL.

Table C-3. Babcock and Wilcox-Lynchburg Crosswalk of Waste Streams
TWBIR Revision 2 to the TWBIR - 2004

| TWBIR Revision 2 Waste Streams | TWBIR - 2004 Waste Streams |
|--------------------------------|----------------------------|
| N/A                            | BL-001                     |

## C-1.4 Battelle Columbus Laboratories (BC)

The TWBIR, Revision 2 reported only one waste stream – BC-T001 for Battelle Columbus Laboratories (BCL). This waste has since been repackaged and characterized. As a result, better data were used to define multiple waste streams.

The TWBIR, Revision 2 value inventory volume, 581 m³ (20,486 ft³), was an estimate based on the storage vault and container dimensions, and included the storage vaults, containers, and the research hot-cells internal volume, and all utilities. The TWBIR - 2004 inventory volume of 35 m³ (1,236 ft³), is based on a well documented and characterized sorting, segregation, compaction, and decontamination process. The result of this process was a 95 percent reduction of the TWBIR, Revision 2 inventory estimate. The weight-dose-to-curie computer modeling program and database developed by the BCL allowed for the segregation of low-level waste from the TRU waste which also helped reduce the TWBIR, Revision 2 inventory estimate.

The waste matrix code for the TWBIR, Revision 2 inventory was S5400-heterogeneous debris. Acceptable Knowledge (AK) documentation is complete. New waste matrix codes for the waste streams were assigned. For example, there are several absorbed liquid waste streams and resins that require an S series waste matrix code. In addition, the Carlsbad Field Office (CBFO) has better defined the requirements for waste designation since the initial inventory baseline was issued.

Finally, TRUCON codes were assigned for the new waste streams for the TWBIR - 2004. These were not known or required for RH-TRU wastes for the TWBIR, Revision 2 inventory.

Table C-4 contains the crosswalk of BCL waste streams from TWBIR Revision 2 to the TWBIR - 2004 for BCL.

Table C-4. Battelle Columbus Laboratories (BC) Crosswalk of Waste Streams
TWBIR Revision 2 to TWBIR - 2004

| * *                            |  |
|--------------------------------|--|

| N/A                            | BCLCH-MT01   |

## C-1.5 Bettis Atomic Power Laboratory (BT)

The TWBIR, Revision 2, for Bettis Atomic Power Laboratory (BAPL) listed five waste streams: BT-T001 through BT-T005. Waste streams BT-T004 and BT-T005 were deleted, as these were radioactive sources that were subsequently placed in the Offsite Source Recovery (OSR) database. Waste stream BT-T003 consisted of waste containing uranium-233. As uranium-233 is no longer considered TRU from a waste disposal standpoint, this waste stream was deleted. This waste will be disposed of at a DOE low-level waste disposal facility. Records indicate that the TWBIR, Revision 2, BT-T001 and BT-T002 volumes were 1.95 m³ (68.87 ft³) and 17.6 m³ (621.6 ft³) respectively—essentially the same as the TWBIR - 2004 inventory values of 2 m³ (70.64 ft³) and 18.6 m³ (656.95 ft³).

Table C-5 contains the crosswalk of the BAPL waste streams from TWBIR Revision 2 to the TWBIR - 2004.

Table C-5. Bettis Atomic Power Laboratory (BT) Crosswalk of Waste Streams
TWBIR Revision 2 to TWBIR - 2004

| TWBIR Revision 2 Waste Streams | TWBIR - 2004 Waste Streams |
|--------------------------------|----------------------------|
| BT-T001                        | BT-T001                    |
| BT-T002                        | BT-T002                    |

| BT-T004                        | N/A                        |
| BT-T005                        | N/A                        |

#### C-1.6 Framatome (FM)

Framatome (FM) is a new waste site that has been added to the TRU waste inventory. Table C-6 identifies the waste streams at Framatome.

Table C-6. Framatome (FM) Crosswalk of Waste Streams TWBIR Revision 2 vs. TWBIR - 2004

| TWBIR Revision 2 Waste Streams | TWBIR - 2004 Waste Streams |
|--------------------------------|----------------------------|
| N/A                            | FM-MOX-MT02                |
| N/A                            | FM-MOX-T01                 |

## C-1.7 General Electric Vallecitos Nuclear Center (VN)

General Electric Vallecitos Nuclear Center (GEVNC) was mentioned in TWBIR Revision 2, but no specific waste streams were identified. The waste streams from GEVNC are now included in the TWBIR - 2004.

Table C-7 identifies the waste streams identified by GE.

Table C-7. General Electric Vallecitos Nuclear Center (VN) Crosswalk of Waste Streams
TWBIR Revision 2 vs. TWBIR - 2004

# C-1.8 Hanford Richland Operations Office (RL)

The TRU waste identified for the Richland Operations Office (RL) is designated with an "RL" site identifier. A significant change in this update for RL is that the inventory information from the Plutonium Finishing Plant has been updated. RL has deleted 11 waste streams that were inadvertently included in the data submittal (Lott 2004a). Many minor updates to other waste streams and additional new waste streams are also identified.

Table C-8 contains the crosswalk of RL waste streams from TWBIR Revision 2 to the TWBIR - 2004.

Table C-8. Hanford Site (RL) Crosswalk of Waste Streams TWBIR Revision 2 vs. TWBIR - 2004

| TWBIR Revision 2 Waste Streams | TWBIR - 2004 Waste Streams |
|--------------------------------|----------------------------|
| RL-T101                        | RL-T101                    |

## C-1.9 Hanford Office of River Protection (RP)

The Hanford Office of River Protection (RP) tanks were discussed in TWBIR Revision 2, but there were no specific waste streams identified. Twelve tanks in four waste streams have been included in the TWBIR - 2004. The tank waste is maintained by the RP and the waste streams are designated with an "RP" site identifier.

Appendix C - 19 -

Table C-9 contains the waste streams identified for the RP tank waste.

Table C-9. Hanford Office of River Protection (RP) Crosswalk of Waste Streams
TWBIR Revision 2 vs. TWBIR - 2004

| TWBIR Revision 2 Waste Streams | TWBIR - 2004 Waste Streams |
|--------------------------------|----------------------------|
| N/A                            | RP-W013                    |
| N/A                            | RP-W016                    |

| N/A                            | RP-W755                    |

## C-1.10 Idaho National Laboratory (IN)

The most significant change at the Idaho National Laboratory (INL) is that the legacy contact-handled (CH)-TRU waste will be processed through the Advanced Mixed Waste Treatment Facility. The CH-TRU debris waste will be compacted in the facility. An average of four compacted 55-gallon drums will be placed into a 100-gallon drum for shipment to the WIPP. Since thermal treatment, as planned and reported in TWBIR Revision 3, is no longer an option, the compaction of the debris waste, the mass of the cellulosic, plastic, and rubber (CPR) materials has increased.

The CH-TRU homogeneous waste will be overpacked into the 10-drum overpack (containing 10 55-gallon drums) for shipment to WIPP.

For the RH-TRU waste, the TWBIR Revision 2 included waste that was potentially RH-TRU waste, as well as waste known to be RH-TRU waste. The TWBIR - 2004 only addresses waste that is known to be RH-TRU waste; therefore, the volume has decreased.

Another significant change at INL is the addition of four waste streams from the pre-1970 waste streams (Lott 2004b).

Table C-10 contains the crosswalk of waste streams from TWBIR Revision 2 to the TWBIR - 2004 for the INL.

Table C-10. Idaho National Laboratory (IN) Crosswalk of Waste Streams TWBIR Revision 2 vs. TWBIR - 2004

Appendix C - 23 -

# C-1.11 Knolls Atomic Power Laboratory (KA)

The moderate increase of the projected volumes of TRU waste for Knolls Atomic Power Laboratory (KAPL) waste streams KA-T001 and KA-W016 between the TWBIR Revision 2 and TWBIR - 2004 are a result of improved estimates of material that is expected to be generated, characterized, and packaged in its final waste form.

The TRU waste inventory volumes listed in TWBIR, Revision 2, for waste stream KA-T001 stored in final form was erroneously listed as  $2.5~\text{m}^3$  ( $88.3~\text{ft}^3$ ). This was incorrect and only a small amount of TRU waste had actually been generated –  $0.2~\text{m}^3$  ( $7.06~\text{ft}^3$ ) (as-generated volume). At the time, there was no TRU waste stored in final waste form. The  $2.5~\text{m}^3$  ( $88.3~\text{ft}^3$ ) listed in the Revision 2 was the projected volume. The TWBIR, Revision 2 should have indicated  $0~\text{m}^3$  of stored TRU waste in its final waste form. The TWBIR - 2004~value is  $0~\text{m}^3$  as there is still no TRU waste in its final waste form.

Table C-11 provides the crosswalk for KAPL waste streams from TWBIR Revision 2 to the TWBIR - 2004.

Table C-11. Knolls Atomic Power Laboratory (KA) Crosswalk of Waste Streams
TWBIR Revision 2 vs. TWBIR - 2004

| TWBIR Revision 2 Waste Streams | TWBIR - 2004 Waste Streams |
|--------------------------------|----------------------------|
| KA-T001                        | KA-T001                    |
| KA-W016                        | KA-W016                    |

## C-1.12 Knolls Atomic Power Laboratory-Nuclear Fuel Services (KN)

Knolls Atomic Power Laboratory-Nuclear Fuel Services (KAPL-NFS) is a new site. This is the first time waste streams from the site have been included in the TRU waste inventory information.

Table C-12 provides the waste streams from KAPL-NFS.

Table C-12. Knolls Atomic Power Laboratory-Nuclear Fuel Services (KN) Crosswalk of Waste Streams TWBIR Revision 2 vs. TWBIR - 2004

| TWBIR Revision 2 Waste Streams | TWBIR - 2004 Waste Streams |
|--------------------------------|----------------------------|
| N/A                            | KN-B234TRU                 |
| N/A                            | KN-B234PCBTRU              |

## C-1.13 Lawrence Livermore National Laboratory (LL)

The inventory of stored waste at Lawrence Livermore National Laboratory (LLNL) increased because of ongoing TRU waste generation. LLNL updated the originally reported numbers for most of the waste streams to reflect the current inventory.

A new high-efficiency particulate air (HEPA) filter mixed waste stream, LL-W034, was established to accommodate several old boxes and one drum.

Table C-13 contains the crosswalk of waste streams from TWBIR Revision 2 to the TWBIR - 2004 for the LLNL.

Table C-13. Lawrence Livermore National Laboratory (LL) Crosswalk of Waste Streams TWBIR Revision 2 vs. TWBIR - 2004

| TWBIR Revision 2 Waste Streams | TWBIR - 2004 Waste Streams |
|--------------------------------|----------------------------|
| LL-M001                        | LL-M001                    |
| LL-T001                        | LL-T001                    |
| LL-T002                        | LL-T002                    |
| LL-T003                        | LL-T003                    |
| LL-T004                        | LL-T004                    |
| LL-T005                        | LL-T005, LL-W034           |
| LL-W018                        | LL-W018                    |
| LL-W019                        | LL-W019                    |

### C-1.14 Los Alamos National Laboratory (LA)

The major differences in the Los Alamos National Laboratory (LANL) submittals for the TWBIR Revision 2 and the TWBIR - 2004 are due to three factors:

- Redefinition of waste streams,
- Addition of waste generated between 1996 and 2003, and
- Addition of radiography characterization data for approximately 5,000 drums.

#### C-1.14.1 Redefinition of Waste Streams

Following the guidance in the draft WIPP Waste Analysis Plan (WAP) (NMED 1999), LANL reorganized its waste streams beginning in 1998 with the publication of the "LANL Waste Characterization Sampling Plan, R.O." Waste streams in the TWBIR, Revision 2, were defined based on major waste material parameter content (e.g., metals, combustible debris). These were further subdivided beginning in 1998 according to the waste generation facility. Waste stream assignments, especially involving the mixed or non-mixed status of wastes, were further refined using additional acceptable knowledge studies in subsequent versions of the "Acceptable Knowledge Information Summary." There is no simple rule for correspondence in waste stream assignment between the LANL submittals for TWBIR, Revision 2 and TWBIR - 2004; improved acceptable knowledge (AK) resulted in numerous waste stream reassignments.

### C-1.14.2 Addition of Waste

LANL continues to generate waste – approximately 1,600 containers were generated between 1996 and the latest TWBIR - 2004 submittal. These have been added to the LANL inventory in the latest data submittal.

# C-1.14.3 Radiography Characterization Data

LANL has obtained real-time radiography (RTR) data for about 5,000 waste drums from almost all of the defined waste streams. RTR supplies information on average, minimum, and maximum waste material parameter content for each waste stream. Isotopic information for each waste stream is still based primarily on AK (generator assays).

Table C-14 contains the crosswalk of waste streams from TWBIR Revision 2 to the TWBIR - 2004 for the LANL.

## C-1.15 Nevada Test Site (NT)

The Nevada Test Site (NTS) has one new waste stream identified in the TWBIR - 2004 from the National Nuclear Security Administration. That new waste stream results from activities from the Joint Actinide Shock Physics Experimental Research (JASPER) Facility.

Table C-15 contains the crosswalk of waste streams from TWBIR Revision 2 to the TWBIR - 2004 for the NTS.

Table C-15. Nevada Test Site Laboratory (NT) Crosswalk of Waste Streams

# C-1.16 Oak Ridge National Laboratory (OR)

### C-1.16.1 Waste Streams

The number of waste streams was reduced from 16 to 9. The reason for the change is to better represent the waste streams that WIPP will receive. The previously identified waste streams were reflective of the stored inventory. The new waste stream information reflects the repackaged waste after sorting, treatment, re-characterization, and repackaging.

Corresponding to the WIPP-ID changes, the waste matrix codes have been updated to reflect the waste stream parameters.

### C-1.16.2 TRUCON Codes

There were no significant changes in the TRUCON codes. Oak Ridge will need to work with WIPP to obtain TRUCON codes for the various waste streams as Oak Ridge approaches

certification. The currently approved Oak Ridge TRUCON codes (OR-125 and OR-225) are still needed.

#### **C-1.16.3 EPA Codes**

The EPA codes were eliminated for the waste because of treatment. The previous waste stream description included EPA codes for characteristic heavy metals including D006, D008, D009, and D011. The current DOE-ORO contract for processing the TRU waste includes treatment to meet the Resource Conservation and Recovery Act (RCRA) Land Disposal Restrictions. Therefore, the TRU waste will not carry the characteristic EPA codes at the time it is sent to WIPP.

### C-1.16.4 Radionuclides

The radioisotope inventory for Oak Ridge has changed considerably. The radioisotope inventories have increased from approximately 125,000 curies in TWBIR, Revision 2 to 245,000 curies in the TWBIR - 2004. The TWBIR Revision 2 information indicated that the predominant isotopes by activity were <sup>60</sup>Co and <sup>110m</sup>Ag, with over a factor of ten reduction to reach the next dominant isotopes (<sup>241</sup>Pu, <sup>241</sup>Am, <sup>90</sup>Sr, <sup>137</sup>Cs, etc.). The TWBIR - 2004 information indicates the predominant isotopes are <sup>241</sup>Pu, <sup>90</sup>Sr, and <sup>137</sup>Cs with over a factor of ten reduction to reach the next dominant isotopes (<sup>238</sup>Pu, <sup>152</sup>Eu, <sup>244</sup>Cm, etc.). The changes in the radioisotope inventory are attributable to three sources:

- Additional characterization information
- Differences in waste processing strategies
- Additional waste streams

Oak Ridge has obtained more reliable characterization data than what existed five years ago. A considerable number of samples have been obtained from the TRU sludge and analyzed. Further characterization was also performed for the CH- and RH-TRU waste debris from the major production facilities in Oak Ridge. The debris characterization effort identified more actinides and other isotopes than were previously included.

Oak Ridge waste processing includes compaction of the waste and size reduction of the waste. Since the TWBIR activities are reported as concentrations (i.e., Ci/m³), compaction and size reduction would increase the concentration. However, a net reduction of radioisotopes will be going to WIPP as a result of waste sorting and segregation. Sorting will generate LLW that will be sent to the NTS. Offsetting the isotope reduction by the generation of LLW is a small increase in the volume of unsorted waste. All told, these changes result in only moderate change to the overall totals.

Oak Ridge has identified a few additional waste streams that have added a significant amount of radioisotopes. These streams include TRU soils, fuel salts, and decontamination and decommissioning (D&D) debris.

### C-1.16.5 Packaging

The packaging, when realigned to the new waste stream designators, has not changed. Oak Ridge plans to send CH-TRU waste in 55-gallon drums and RH-TRU waste in 72B canisters.

### **C-1.16.6 Volumes**

The volume of waste being sent from Oak Ridge to WIPP has decreased from approximately 3,800 m³ (134,216 ft³) in TWBIR Revision 2 to 1,100 m³ (38,852 ft³) in the TWBIR - 2004. This is mostly attributable to the planned volume reduction techniques during waste processing including waste segregation (LLW from TRU), compaction, size reduction, and evaporative drying for sludge.

The Oak Ridge submittal for the TWBIR - 2004 is focused on the projected volumes, not the current volumes. The reason for the emphasis on projected volumes is that the Oak Ridge waste streams will be completely repackaged and will include considerable volume reduction to most of the waste streams. The repackaged waste is what will be sent to WIPP. The effort to prepare the TWBIR - 2004 information included a detailed evaluation of the projected volumes.

For the debris and homogeneous solids (sludge), the inventory information for TWBIR, Revisions 2 and 4 are essentially the same. The addition of environmental restoration waste streams (i.e., soil, salts, TRU Waste polychlorinated biphenyls [PCB]) resulted in new waste material parameter for those waste streams.

There is a significant change between WMP densities in TWBIR, Revision 2 and the TWBIR - 2004 due to the compaction and size reduction efforts previously discussed. Also, new waste streams (such as soil) have been added and their specific WMP densities are included in the TWBIR - 2004.

Table C-16 contains the crosswalk of waste streams from TWBIR Revision 2 to the TWBIR - 2004 for the ORNL.

Table C-16. Oak Ridge National Laboratory (OR) Crosswalk of Waste Streams

# C-1.17 Paducah Gaseous Diffusion Plant (PA)

There were no changes to the Paducah waste streams from TWBIR, Revision 2 to TWBIR - 2004. Table C-17 contains the crosswalk of waste streams from TWBIR Revision 2 to the TWBIR - 2004 for the Paducah Gaseous Diffusion Plant.

Table C-17. Paducah Gaseous Diffusion Plant Laboratory (RA) Crosswalk of Waste Streams TWBIR Revision 2 vs. TWBIR - 2004

| TWBIR Revision 2 Waste Streams | TWBIR - 2004 Waste Streams |
|--------------------------------|----------------------------|

# C-1.18 Rocky Flats Environmental Technology Site (RF)

The major changes in the Rocky Flats Environmental Technology Site (RFETS) waste streams are that all the residues have been re-characterized as waste and have been processed and packaged as TRU or TRU mixed (MTRU) waste. Many waste streams were renamed from mixed residues (MR) waste to mixed TRU (MT) waste or TRU residues (TR) to TRU TRU (TT). Also, several new waste streams have been added. N/A for a waste stream indicates no inventory.

The waste material parameters (WMPs) and the radionuclide concentration in curies per cubic meter (Ci/m³) are based on data from WIPP-approved RTR or assay systems.

Table C-18 contains the crosswalk of waste streams from TWBIR Revision 2 to the TWBIR - 2004 for the RFETS.

### C-1.19 Sandia National Laboratories (SA)

### **C-1.19.1 Inventory Changes**

The TWBIR, Revision 2, for Sandia National Laboratories, New Mexico (SNL/NM) included two waste streams: SA-W134 – Transuranic Waste at Hot Cell Facility and SA-T001 – Lovelace Inhalation Toxicology Research Institute (ITRI) Waste Stream. The TWBIR - 2004, renamed one waste stream, SA-W134 – TRU Waste from SNL/NM – Contact-Handled and created one new waste stream, SA-W135 – TRU Waste from SNL/NM – Remote-Handled. The total waste covered by these two waste streams shows an increase in volume from the TWBIR, Revision 2. This increase is due to the TRU waste volume generated during the decontamination and decommissioning of the Hot Cell Facility at SNL/NM Technical Area V being greater than originally anticipated, additional TRU waste identified during re-characterization efforts of legacy waste stored by SNL/NM, and an effort to identify nuclear material that has no defined use at the laboratory.

Appendix C - 37 -

The updated volume for SA-T001 – Lovelace ITRI Waste Stream has been reduced from the TWBIR, Revision 2. This is due to a mission change at the Lovelace Respiratory Research Institute (LRRI). It is no longer a DOE-funded facility and its work with radioactive material, especially transuranic isotopes, has been greatly reduced. Any additional TRU waste generated by the facility will be the result of D&D efforts.

Table C-19 contains the crosswalk of waste streams from TWBIR Revision 2 to the TWBIR - 2004 for the SNL.

Table C-19. Sandia National Laboratories (SA) Crosswalk of Waste Streams
TWBIR Revision 2 vs. TWBIR - 2004

| TWBIR Revision 2 Waste Streams | TWBIR - 2004 Waste Streams |  |  |
|--------------------------------|----------------------------|--|--|

| SA-W134                        | SA-W134, SA-W134M, SA-W135 |  |  |
| SA-Z001                        | SA-Z001                    |  |  |

### C-1.20 Savannah River Site (SR)

The TWBIR, Revision 2, contained 47 specific waste streams for the Savannah River Site (SRS); 18 waste streams were TRU and 29 waste streams were mixed TRU (MTRU). The reported stored inventory was 9,194 m³ (324,732 ft³). In TWBIR, Revision 2, the technology identified for treating part of the inventory was vitrification that had a volume reduction ratio of 30 to 1. Also included was size reduction for large metal components that had to fit into standard waste boxes (SWBs). The size reduction ratio used was 3.5 to 1. As a result, the final waste forms identified were vitrified debris, heterogeneous debris, and metal debris.

The SRS has consolidated the 47 waste streams into 20 waste streams. This is because vitrification will no longer be implemented for treatment and the large metal components will only be size-reduced to fit into 5 ft by 5 ft by 8 ft containers. As a result, the vitrified and metal waste streams have been deleted and are now included in the heterogeneous debris waste streams. The reported TWBIR - 2004, stored inventory is 11,612 m<sup>3</sup> (410,135.8 ft<sup>3</sup>).

The SRS also identifies five future waste streams to be generated as a result of pit disassembly and waste solidification activities. It also identifies the future generation of 270 m<sup>3</sup> (9,536.4 ft<sup>3</sup>) of waste from Mound. This is the inventory currently being shipped to SRS. As shown in Table C-20, all 13 waste streams from Mound (identified in TWBIR, Revision 2) are accounted for in Waste Stream W027-999-HET (TWBIR - 2004).

Having compared the EPA Hazardous Waste codes between TWBIR, Revision 2 and TWBIR - 2004, five codes have been added in the TWBIR - 2004. The five codes are D029, D035, D039, D040, and D043. These codes were added as a result of Acceptable Knowledge report development.

Table C-20 contains the crosswalk of waste streams from TWBIR Revision 2 to the TWBIR - 2004 for the SRS.

# C-1.21 Separations Process Research Unit (SP)

The Separations Process Research Unit (SPRU) was mentioned in TWBIR Revision 2, but no waste streams were identified. One waste stream from SPRU is now included in TWBIR - 2004.

Table C-21 provides the waste stream from SPRU.

Table C-21. Separations Process Research Unit (SP) Crosswalk of Waste Streams TWBIR Revision 2 vs. TWBIR - 2004

| TWBIR Revision 2 Waste Streams | TWBIR - 2004 Waste Streams |  |
|--------------------------------|----------------------------|--|
| N/A                            | SP-T001                    |  |

# C-1.22 U.S. Army Material Command (MC)

No changes were reported for the U.S. Army Material Command (USAMC) waste streams with this TWBIR - 2004.

Table C-22 contains the crosswalk of waste streams from TWBIR Revision 2 to the TWBIR - 2004 for the USAMC.

Table C-22. U.S. Army Material Command (MC) Crosswalk of Waste Streams

# C-1.23 West Valley Demonstration Project (WV)

Four waste streams were removed from the inventory as a result of re-characterization. Final form inventory was reduced because of size reduction and repackaging.

A Remote-Handled Waste Facility (RHWF) is being constructed to sort, characterize, size-reduce, decontaminate, and repackage waste currently stored on site. Operations at the RHWF are expected to begin in the first quarter of fiscal year 2005. As a result of this new facility, the RH-TRU waste portion of West Valley Demonstration Project (WVDP) waste, final form has been reduced. One additional waste stream number has been assigned for inventory tracking purposes as a result of the RHWF Process. The WV-T021 waste stream is a subset of waste stream WV-T001, Fissile Material, as shown in Table C-23.

Three decontamination projects were initiated and three additional waste stream numbers were assigned for inventory tracking purposes as shown in Table C-23.

Table C-23 contains the crosswalk of waste streams from TWBIR Revision 2 to the TWBIR - 2004 for the WVDP.

#### **D-1.0 INTRODUCTION**

The calculations for the packaging material densities (also referred to as container material densities) for steel, plastic, or lead present in each type of transuranic (TRU) waste container that will be shipped to the Waste Isolation Pilot Plant (WIPP) are based on packaging assumptions found in the *Transuranic Waste Baseline Inventory Report* (TWBIR), Revision 2, Chapter 1 (DOE 1995) and on data documented in the TRUPACT-II Authorized Methods for Payload Control (TRAMPAC; DOE 2004a). Additional details concerning waste material parameters or packaging materials can be found in Table M-6 of Appendix M of this document. This appendix describes how packaging material densities are determined for sites where limited or no information was provided.

This appendix consists of two parts. In the first part, the general packaging material densities are given for directly loaded containers including 55-gallon drums, 85-gallon drums, 100-gallon drums, and standard waste boxes (SWBs). This part also includes the methods used to determine the packaging material densities when waste containers are overpacked, such as four 55-gallon drums overpacked in an SWB or ten 55-gallon drums overpacked in a ten-drum overpack (TDOP). These general methods are based on TWBIR, Revision 2 (DOE 1995) and the TRAMPAC (DOE 2004a). The calculations to estimate the packaging material densities in kilograms per cubic meter (kg/m³) are presented in Section D-2.0.

The second part of this appendix summarizes the methods used to calculate and document packaging material densities on a site-by-site basis. These summaries are based on several "Routine Calculations" that were developed and documented under Sandia National Laboratories (SNL) Nuclear Waste Management Program Procedure, NP 9-1, Analyses (SNL 2001). These routine calculations were conducted after a thorough review of the inventory information revealed that some waste streams required modification to allow for shipping container volume. For example, some sites reported the current packaging configuration of their waste streams instead of the configuration that the waste would be in when shipped to and disposed in WIPP. Although this information was accurate and complete, the result was that the waste volumes reported did not truly reflect the volume the waste will occupy when disposed in WIPP. Waste volume accuracy in this regard is vital for the Performance Assessment (PA) calculations in support of the Compliance Recertification Application 2004 (DOE 2004b) and the Performance Assessment Baseline Calculation (PABC) (Leigh et al. 2005a, Leigh et al. 2005b). The routine calculations serve to repair this discrepancy in the volumes and apply the new volumes to the waste and packaging material densities and the radionuclide concentrations. The methods used to estimate the packaging material densities in kg/m<sup>3</sup> are summarized in Section D-3.0, with reference to the actual routine calculations by SNL WIPP Records Center, Electronic Records Management System (ERMS) number.

### D-2.0 GENERAL PACKAGING MATERIAL DENSITIES

# D-2.1 Packaging Material Densities for a Directly Loaded 55-Gallon Drum

### **D-2.1.1** Steel

A 55-gallon drum is made of steel and weighs 27.2 kg (60 lbs) (DOE 2004a). The density of steel for the drum is calculated as follows:

Density of Steel = 
$$\frac{27.2 \text{ kg}}{0.208 \text{ m}^3 \text{ per drum}}$$
 =  $131 \text{ kg/m}^3$ 

### D-2.1.2 Plastic

The rigid liner in a 55-gallon drum weighs 7.7 kg (17 lbs) (DOE 1995). The density of plastic packaging in a 55-gallon drum is calculated as follows:

Density of Plastic = 
$$\frac{7.7 \text{ kg}}{0.208 \text{ m}^3}$$
 =  $37 \text{ kg/m}^3$ 

# D-2.2 Packaging Material Densities for a Directly Loaded 85-Gallon Drum

A request was submitted to the Nuclear Regulatory Commission (NRC) in October 2002 to approve directly loaded 85-gallon drums as payload containers as part of the CH TRAMPAC Revision 1 (DOE 2004a). This has now been approved as a WIPP shipping container.

Additionally, the TRAMPAC, Revision 1 (DOE 2002) used the term "85-gallon drum" to refer to "drums with a range of dimensions yielding 75 to 88 gallons." Therefore, it is assumed that the density for 85-gallon drums applies to all drums between 75 and 88 gallons.

### **D-2.2.1** Steel

The weight of the 85-gallon drum is 36.7 kg (81 lbs) (DOE 2004a). The volume of an 85-gallon drum is 0.322 m<sup>3</sup>. The density of steel for the 85-gallon drum is calculated as follows:

Density of Steel = 
$$\frac{36.7 \text{ kg}}{0.322 \text{ m}^3 \text{ per } 85\text{-gallon drum}}$$
 =  $\frac{114 \text{ kg/m}^3}{114 \text{ kg/m}^3}$ 

### D-2.2.2 Plastic

It is assumed that no plastic liners are used. Therefore, the value used for the plastic packaging material is  $0.0 \text{ kg/m}^3$ .

# D-2.3 Packaging Material Densities for a Directly Loaded 100-Gallon Drum

The 100-gallon drum is currently authorized for shipment in the TRUPACT-II (DOE 2004a) and has been added as an authorized payload container for the HalfPACT.

### **D-2.3.1** Steel

The weight of a steel, 100-gallon drum is 43.1 kg (95 lbs) (DOE 2004a). The volume of a 100-gallon drum is 0.379 m<sup>3</sup>. The density of steel for the 100-gallon drum is calculated as follows:

Density of Steel = 
$$\frac{43.1 \text{ kg}}{0.379 \text{ m}^3 \text{ per } 100\text{-gallon drum}}$$
 =  $\frac{114 \text{ kg/m}^3}{0.379 \text{ m}^3 \text{ per } 100\text{-gallon drum}}$ 

### D-2.3.2 Plastic

It is assumed that no plastic liners are used. Therefore, the value used for the plastic packaging material is  $0.0 \text{ kg/m}^3$ .

## D-2.4 Packaging Material Densities for a Directly Loaded Standard Waste Box

### **D-2.4.1** Steel

A SWB is made of steel and weighs 290.2 kg (640 lbs) (DOE 2004a). The volume of an SWB is 1.89 m<sup>3</sup>. The amount of steel is calculated as follows:

Density of Steel = 
$$\frac{290.2kg}{1.89 \text{ m}^3 \text{ per SWB}}$$
 =  $\frac{154 \text{ kg/m}^3}{1.89 \text{ m}^3}$ 

### D-2.4.2 Plastic

The plastic liner in a directly loaded SWB weighs approximately 2.27 kg (5 lbs) (DOE 1995). The plastic packaging density in a directly loaded SWB is calculated as follows:

Density of Plastic = 
$$\frac{2.27 \text{ kg}}{1.89 \text{ m}^3}$$
 =  $1.2 \text{ kg/m}$ .

# D-2.5 Packaging Material Densities for a Directly Loaded Remote-Handled-Transuranic Waste Canister

There are two remote-handled (RH)-TRU waste canister designs available for use by the generator sites. One contains lead, the other does not. Since it was uncertain which canister would be used at the time of this report, this calculation uses the same assumption as that for the TWBIR Revision 2 (DOE 1995), and lead is included as packaging material for RH-TRU waste canisters.

### **D-2.5.1** Steel

The total weight of an empty RH-TRU waste canister is 799 kg (1,762 lbs), of which 386 kg (852 lbs) is steel and 413 kg (910 lbs) is lead (DOE 1995). This does not include the shield plug (included in emplacement materials). The volume of the RH-TRU waste canister is 0.89 m<sup>3</sup>. The density of steel for the RH-TRU waste canister is calculated as follows:

Density of Steel = 
$$\frac{386 \text{ kg}}{0.89 \text{ m}^3}$$
 =  $\frac{434 \text{ kg/m}^3}{\text{per RH-TRU waste canister}}$ 

### D-2.5.2 Plastic

For a directly loaded RH-TRU waste canister, it is assumed there would be no plastic packaging involved. Therefore, the amount of plastic for this case is zero.

### D-2.5.3 Lead

The weight of lead in the RH-TRU waste canister is 413 kg (910 lbs) (DOE 1995), and the volume is 0.89 m<sup>3</sup>. The density of lead is calculated as follows:

Density of Lead = 
$$\frac{413 \text{ kg}}{0.89 \text{ m}^3}$$
 =  $\frac{464 \text{ kg/m}^3}{\text{per RH-TRU waste canister}}$ 

# D-2.6 Packaging Material Densities for a Standard Waste Box Used to Overpack Four 55-Gallon Drums

#### **D-2.6.1** Steel

For the case of four 55-gallon drums overpacked in an SWB, the total weight of steel is a combination of the steel in the SWB and the steel in the 55-gallon drums. The weight of a 55-gallon drum is 27.2 kg (60 lbs) and the weight of an SWB is 290.2 kg (640 lbs) (NRC 2003). The density of steel for the SWB containing four 55-gallon drums is calculated as follows:

Density of Steel = 
$$(4 \text{ drums } x \text{ } 27.2 \text{ kg steel per drum} + 290.2 \text{ kg})$$
 =  $211 \text{ kg/m}^3$   
 $1.89 \text{ m}^3 \text{ per SWB}$ 

### D-2.6.2 Plastic

It is assumed that the plastic liner for the SWB will not be used when the drums are overpacked in the SWB. Thus, the plastic will be contributed entirely by the rigid liners in the four overpacked drums (refer to Section D-2.1.2 for plastic assigned to 55-gallon drums). The density of plastic packaging is calculated as follows:

Density of Plastic = 
$$\frac{4 \text{ drums } \times 7.7 \text{ kg of plastic per drum}}{1.89 \text{ m}^3 \text{ per SWB}}$$
 =  $\frac{16 \text{ kg/m}^3}{1.89 \text{ m}^3 \text{ per SWB}}$ 

# D-2.7 Packaging Material Densities for a Remote-Handled TRU-Waste Canister Used to Over-Pack Three 55-Gallon Drums

#### **D-2.7.1** Steel

For the case of three 55-gallon drums overpacked in a RH-TRU waste canister, the total weight of steel is a combination of the steel in the RH-TRU waste canister and steel in the three 55-gallon drums. The weight of a 55-gallon drum is 27.2 kg (60 lbs) (DOE 2004a) and the weight of steel in an RH-TRU waste canister is 386 kg (852 lbs) (DOE 1995). The density of steel for the RH-TRU waste canister with three 55-gallon drums in it is calculated as follows:

Density of Steel = 
$$(3 \text{ drums } x \text{ } 27.2 \text{kg}) + 386 \text{ kg}$$
 =  $525 \text{ kg/m}^3$   
 $0.89 \text{ m}^3 \text{ per RH-TRU } \text{ waste canister}$ 

### D-2.7.2 Plastic

The plastic will be contributed entirely by the rigid liners in the three overpacked 55-gallon drums. The plastic liners weigh approximately 7.7 kg (17 lbs) each (DOE 1995) and are in the total volume of the RH-TRU waste canister. The density of plastic packaging is calculated as follows:

Density of Plastic = 
$$\frac{3 \text{ drums } x 7.7 \text{ kg of plastic per drum}}{0.89 \text{ m}^3 \text{ per RH-TRU waste canister}} = \frac{26 \text{ kg/m}^3}{26 \text{ kg/m}^3}$$

### **D-2.7.3** Lead

Since the 55-gallon drums do not contribute any lead, the calculation for this case is the same as that of a directly loaded RH-TRU waste canister (464 kg/m<sup>3</sup>), as calculated in Section D-2.5.

# D-2.8 Packaging Material Densities for Ten 55-Gallon Drums in a Ten-Drum Overpack

### **D-2.8.1** Steel

For the case of ten 55-gallon drums overpacked in a TDOP, the total weight of steel is a combination of the steel in the TDOP and the ten 55-gallon drums. The weight of an empty TDOP is 771 kg (1,700 lbs) (DOE 2004a). The volume of a TDOP is 4.79 m<sup>3</sup>. The weight of a 55-gallon drum is 27.2 kg. The density of steel packaging in the TDOP containing 10 drums is calculated as follows:

Density of Steel = 
$$(10 \text{ drums } x 27.2 \text{ kg}) + 771 \text{ kg}$$
 =  $218 \text{ kg/m}^3$   
 $4.79 \text{ m}^3 \text{ per TDOP}$ 

### D-2.8.2 Plastic

The plastic in the TDOP will be contributed entirely by the rigid liners in the 10-drum overpacks. The density of plastic packaging is calculated as follows (see plastic assignment for 55-gallon drums in Section D-2.1.2):

Density of Plastic = 
$$\frac{10 \text{ drums } \times 7.7 \text{ kg of plastic per drum}}{4.79 \text{ m}^3 \text{ per TDOP}} = \frac{16 \text{ kg/m}^3}{4.79 \text{ m}^3 \text{ per TDOP}}$$

### D-3.0 TRU WASTE SITE PACKAGING MATERIAL DENSITIES

Several generator sites originally reported inventory information in a way that did not reflect the volume the waste would occupy when disposed in WIPP. The volume of waste needed for the PABC (Leigh et al. 2005a; Leigh et al. 2005b) is the volume that will be disposed in WIPP. Therefore, packaging information and calculations were reviewed and adjusted as necessary to reflect the volume the waste would occupy once disposed in WIPP. Table D-1 lists the large and small quantity TRU waste generator sites that required some adjustment of their packaging material densities, along with the ERMS reference number for the associated routine calculation.

Table D-1. TRU Waste Generator Sites and Associated ERMS Numbers for Routine Calculations Related to Packaging Material Densities

| Generator Site                                  | ERMS # for Routine Calculation                                 |  |  |
|---|--|--|--|
| Hanford Richland Operations Office (Hanford RL) | 530693   |  |  |
| Hanford Office of River Protection (Hanford RP) | 530675   |  |  |
| Idaho National Laboratory (INL)                 | 530666 (IN-BN-510)<br>530688 (Non-Debris)<br>530679 (RH/Other) |  |  |
| Los Alamos National Laboratory (LANL)           | 530717   |  |  |
| Argonne National Laboratories East (ANL-E)      | 530643   |  |  |
| Argonne National Laboratories West (ANL-W)      | 530639   |  |  |
| Battelle Columbus Laboratories (BCL)            | 530634   |  |  |
| Energy Technology Engineering Center (ETEC)     | 530658   |  |  |
| Knolls Atomic Power Laboratory (KAPL)           | 530648   |  |  |
| Lawrence Livermore National Laboratory (LLNL)   | 530662   |  |  |
| Paducah Gaseous Diffusion Plant (PGDP)          | 530670   |  |  |

Table D-2 contains a summary of the packaging configurations and packaging material densities for sites whose packaging required updating to obtain the volume needed for the PA in support of the PABC (Leigh et al. 2005a; Leigh et al. 2005b). The processes used to obtain these results are described in Sections D-3.1 through D-3.11.

Table D-2. Summary of Packaging Configurations and Packaging Material Densities

| Generator Site <sup>1</sup> | Packaging Configuration <sup>2</sup>  | Steel Packaging Material Density (kg/m³)³ | Plastic<br>Packaging<br>Material<br>Density<br>(kg/m³)³ | Lead Packaging Material Density (kg/m³)³ |
|-----------------------------|---|---|---|--|
| Hanford RL                  | Directly loaded 55-gallon drums   | 131                                       | 37  | 0  |
|                             | Directly loaded SWBs  | 154                                       | 1.2   | 0  |

|                             | One 30-gallon drum overpacked in one 55-gallon drum   | 207                                       | 37  | 0  |
|                             | Other/unknown containers overpacked in 55-gallon drums  | 131                                       | 37  | 0  |
|                             | Crates, fiberglass-reinforced polyethylene (FRP) boxes, and other/unknown large containers into SWBs or standard large boxes (SLBs) | 154                                       | 1.2   | 0  |
|                             | Repackaging crates, FRP boxes, and other/unknown large containers into SWBs   | 154                                       | 1.2   | 0  |
| ANL-E                       | Three 30-gallon drums overpacked in an RH-TRU waste canister  | 481                                       | 15  | 464                                      |
| ANL-W                       | Three 45-gallon drums overpacked in an RH-TRU waste canister  | 511                                       | 21  | 464                                      |
| BCL                         | Three 55-gallon drums overpacked in an RH-TRU waste canister  | 770                                       | 17  | 464                                      |
| ETEC                        | Three 55-gallon drums overpacked in an RH-TRU waste canister  | 525                                       | 26  | 464                                      |
| KAPL                        | Three 55-gallon drums overpacked in an RH-TRU waste canister  | 525                                       | 26  | 464                                      |
| LLNL                        | Repackaging large boxes into SWBs or SLBs   | 154                                       | 0   | 0  |
| PGDP                        | Four 55-gallon drums overpacked in an SWB   | 212                                       | 17.5  | 0  |

See the TWBIR - 2004 and the acronym section of this report.
 This is the packaging configuration determined to be acceptable for shipment to and disposal in WIPP.
 These are the new packaging material densities as calculated, in the routine calculations listed in Table D-1.

# **D-3.1 Hanford Richland Packaging Material Densities**

Hanford Richland (RL) originally reported 229 contact-handled (CH)-TRU and 119 RH-TRU waste streams (ERMS# 526736). The site had misinterpreted the "R" in one of their database fields to mean RH-TRU waste when it actually indicated that the waste was radioactive. The result was that Hanford RL actually had 306 CH-TRU waste streams and 42 RH-TRU waste streams. Therefore, 77 waste streams required a change in the shipping container from a RH-TRU waste canister to other packaging acceptable for CH-TRU waste shipment and disposal. As a result, the packaging material densities for the 77 CH-TRU waste streams were recalculated. Hanford RL submitted updated information indicating the appropriate shipping containers (Cooney 2003). The new shipping containers were directly loaded 55-gallon drums and SWBs. The packaging material densities for the 55-gallon drums and SWBs were determined as shown in Sections D-2.1 and D-2.4, respectively.

The updated volume of waste that will be received at the WIPP, the corresponding waste and packaging material densities, and the radionuclide concentrations were determined and documented in *Calculation of Waste Stream Volumes, Waste Material Densities, Container Material Densities, and Radionuclide Concentrations for Corrected Hanford (RL) Waste Streams for the Compliance Recertification Application* (Lott and Leigh, 2003a). The packaging material densities for these 77 waste streams were adjusted according to the results of this calculation.

# D-3.2 Hanford River Protection Packaging Material Densities

Hanford River Protection (RP) originally reported two of its waste streams in a way that did not reflect the volume that the waste will occupy when disposed in WIPP (ERMS #526473). Specifically, Hanford RP intends to ship these waste streams in 55-gallon drums overpacked in RH-TRU waste canisters. However, the waste volume reported was determined using the internal volume of the three 55-gallon drums ( $3 \times 0.21 = 0.63 \text{ m}^3$ ) instead of the volume of the RH-TRU waste canister ( $0.89 \text{ m}^3$ ), which is representative of the volume of waste to be emplaced in WIPP. The waste stream volume and the packaging material densities were recalculated based on the volume of the RH-TRU waste canister ( $0.89 \text{ m}^3$ ), as shown in Section D-2.7 for three 55-gallon drums overpacked in an RH-TRU waste canister.

The updated volume of waste that will be received at the WIPP, the corresponding waste and packaging material densities, and the radionuclide concentrations were determined and documented in *Calculation of Waste Stream Volumes, Waste and Container Material Densities, and Radionuclide Concentrations for RP RH TRU Waste Streams RP-W013 and RP-W016 for the Compliance Recertification Application* (Lott and Leigh 2003b). The packaging material densities for these two RH-TRU waste streams were adjusted according to the results of this calculation.

### D-3.3 Idaho National Laboratory Packaging Material Densities

Idaho National Laboratory (INL) originally reported several of its waste streams in a way that did not reflect the volume that the waste will occupy when disposed in WIPP. Three routine calculations were developed for the INL waste streams. The first focuses on the supercompacted waste stream originating from the Advanced Mixed Waste Treatment Facility (AMWTF). The second routine calculation discusses the non-debris waste streams from the AMWTF. The third routine calculation covers 13 other INL waste streams for which the packaging configurations did not reflect the volume that the waste will occupy in WIPP. These three routine calculations consistently estimate the packaging material densities for each of the disposal container types and are referenced and summarized below.

### D-3.3.1 Super-Compacted Debris Waste Stream IN-BN-510

The density of steel was calculated based on information received from INL about empty drum weight (100 lbs) and numbers of drums in the IN-BN-510 waste stream (Lott and Leigh, 2003c). The resultant density of the empty drums at INL was determined to be 119.7 kg/m<sup>3</sup>.

# D-3.3.2 Advanced Mixed Waste Treatment Facility Non-Debris Waste Streams

The INL reported 38 non-debris waste streams originating from the AMWTF (Wells 2003). However, updated information from INL (Leigh 2003) revealed changes in the shipping container type and a resulting change in the volume of waste to be received at the WIPP. Specifically, INL originally reported only TDOPs as shipping containers, but its updated information identified both TDOPs and SWBs as shipping containers for each waste stream. Therefore, there were two cases considered regarding packaging material densities: ten 55-gallon drums overpacked in a TDOP, and four 55-gallon drums overpacked in an SWB.

The steel packaging material densities reported in the original submittal from INL were calculated based on the original densities given by the site that were based on the total waste stream volumes, and the total volume of the TDOP (4.79 m³). However, INL updated its information indicating that each waste stream would be packaged in 55-gallon drums that would then be overpacked in SWBs and TDOPs. Therefore, the packaging material densities were recalculated based on the number of TDOPs and SWBs for each waste stream as given by INL in its updated information. Further, the original calculations were done using the actual volume of ten 55-gallon drums of waste (2.08 m³) instead of the volume that the waste actually occupies (4.79 m³). As a result, the mass of steel did not vary for the TDOP, but the volume increased, causing the steel packaging material density to decrease from 480 kg/m³ to 208 kg/m³. The plastic packaging material density originally reported by INL varied by waste stream. However, the mass of plastic did not change and, for most of the waste streams, the plastic packaging material density decreased from 55 kg/m³ to 24 kg/m³.

For the SWBs, the steel and plastic packaging material densities were calculated in the routine calculation based on the volume of the SWB (1.89 m<sup>3</sup>), as shown in Section D-2.6, for four 55-gallon drums overpacked in an SWB.

The updated volume of waste that will be received at the WIPP, the corresponding waste and packaging material densities, and the radionuclide concentrations were determined and documented in *Calculation of Waste Stream Volumes, Waste and Container Material Densities, and Radionuclide Concentrations for Non-Debris AMWTF Waste Streams at INEEL for the Compliance Recertification Application* (Leigh and Lott 2003d). The packaging material densities for these 38 waste streams were adjusted according to the results of this calculation.

# D-3.3.3 Idaho National Laboratory Waste Streams Requiring Overpacking

The INL reported its waste streams based, for the most part, on the current packaging configuration of the waste. For 13 of its waste streams, the current packaging configuration did not match the intended shipping configuration. For example, 55-gallon drums were reported, but INL actually intends to ship these drums inside SWBs.

The updated volume of waste that will be received at the WIPP, the corresponding waste and packaging material densities, and the radionuclide concentrations were determined and documented in *Calculation of Final Form Values For IN-AE-AGHC-01, IN-INTEC-SFS-01, IN-NRF-153, IN-W219.914, IN-W322.851, IN-W323.562, IN-W337.957, IN-W341.954, IN-W342.652, IN-W358.854, IN-W358.949, IN-W372.832, and IN-W372.918 for the Compliance Recertification Application* (Fox and Lott 2003). The packaging material densities for these 13 waste streams were adjusted according to the results of this calculation. The calculations needed for the packaging material densities for these INL waste streams in the routine calculation are summarized below.

# D-3.3.3.1 Overpacking Three 55-Gallon Drums into a Remote-Handled Transuranic Waste Canister

The packaging configuration for two of the 13 INL waste streams was determined to be three 55-gallon drums overpacked in an RH-TRU waste canister. Therefore, the steel and plastic packaging material densities were determined in the routine calculation based on the volume of the RH-TRU waste canister (0.89 m³), as shown in Section D-2.7 for three 55-gallon drums overpacked in an RH-TRU waste canister. The packaging material densities were calculated to be steel, 525 kg/m³; plastic, 26 kg/m³; and lead, 464 kg/m³.

# D-3.3.3.2 Overpacking Three 30-Gallon Drums into a Remote-Handled Transuranic Waste Canister

The packaging configuration for three of the 13 INL waste streams was determined to be three 30-gallon drums overpacked in an RH-TRU waste canister. Therefore, the steel and plastic packaging material densities were determined in the routine calculation based on the volume of the RH-TRU waste canister (0.89 m³). The calculation is similar to that shown in Section D-2.7 for three 55-gallon drums overpacked in an RH-TRU waste canister, except that the total weight of steel for this case was determined based on the steel packaging material density given by the site for the 30-gallon drum (168 kg/m³). The resulting steel packaging material density was 498 kg/m³. Since the only source of lead is the RH-TRU waste canister, the lead packaging material density is 464 kg/m³, as calculated in Section D-2.7. No plastic packaging was reported by the site for the 30-gallon drums.

# D-3.3.3.3 Overpacking Four 55-Gallon Drums into a Standard Waste Box

The packaging configuration of the remaining eight INL waste streams was determined to be four 55-gallon drums overpacked in a SWB. Therefore, the steel and plastic packaging material densities were calculated in the routine calculation, as shown in Section D-2.6, for four 55-gallon drums overpacked in an SWB.

### D-3.4 Los Alamos National Laboratory Packaging Material Densities

Los Alamos National Laboratory (LANL) reported its waste streams based on the current packaging configuration of the waste. Of the 63 waste streams reported by LANL, 33 were reported with unacceptable containers for shipment to WIPP in the TRUPACT-II (DOE 2004a). Of the 33 waste streams, 27 waste streams were reported with containers that require overpacking prior to shipment, and six waste streams have container types that will require repackaging prior to shipment.

The updated volume of waste that will be received at the WIPP, the corresponding waste and packaging material densities, and the radionuclide concentrations were determined and documented in *Calculation of Waste Stream Volumes, Waste Material Densities, Container Material Densities, and Radionuclide Concentrations for LANL Waste Streams for the Compliance Recertification Application* (Sparks and Leigh 2003). The packaging material densities for these 33 waste streams were adjusted according to the results of this calculation. The calculations needed for the packaging material densities of the LANL waste streams in the routine calculation are summarized below.

# D-3.4.1 Overpacking 15-Gallon Drums into a 55-Gallon Drum

LANL reported 15-gallon drums for one waste stream. In this calculation, it was assumed that three 15-gallon drums would be placed in one 55-gallon drum. The calculated steel packaging material density for one 55-gallon drum and three 15-gallon drums was 262 kg/m<sup>3</sup>. The plastic packaging material density for a 55-gallon drum liner was calculated as shown in Section D-2.1 for a directly loaded 55-gallon drum (37 kg/m<sup>3</sup>).

# D-3.4.2 Overpacking 30-Gallon Drums into 55-Gallon Drums

LANL reported 30-gallon drums for several waste streams. In this calculation, it was assumed that one 30-gallon drum would be placed in one 55-gallon drum. The calculated steel packaging material density for one 55-gallon drum and one 30-gallon drum was 207 kg/m<sup>3</sup>. The plastic packaging material density for a 55-gallon drum liner was calculated as shown in Section D-2.1 for a directly loaded 55-gallon drum (37 kg/m<sup>3</sup>).

# D-3.4.3 Overpacking Small Containers (Including "Other," "Unknown," and "Cardboard Box" into 55-Gallon Drums)

LANL reported other or unknown containers that will fit into 55-gallon drums for several waste streams. Because the container volumes of the other/unknown containers vary by waste stream, and the container materials and dimensions were not provided by the site, the packaging

materials for a directly loaded 55-gallon drum, as shown in Section D-2.1, were used (density of steel =  $131 \text{ kg/m}^3$ , and density of plastic =  $37 \text{ kg/m}^3$ ).

# D-3.4.4 Overpacking Crates, Fiberglass-Reinforced Polyethylene Boxes, or Other/Unknown Large Containers into Standard Waste Boxes or Standard Large Boxes

LANL reported crates, fiberglass-reinforced polyethylene (FRP) boxes, and "other" or "unknown" containers of various sizes. However, since the only acceptable large shipping containers are the SWB and the SLBs, all crates, FRP boxes, and unknown/other containers that will fit into the SWBs and SLBs must be overpacked into the SWBs or SLBs.

Because the container volumes of the crates, FRP boxes, and other/unknown containers varied by waste stream, and the container materials and dimensions were not provided by LANL, the packaging material densities for a directly loaded SWB, as shown in Section D-2.4, were used in the routine calculation for the SLBs.

# D-3.4.5 Repackaging (Size Reduction) of Crates, Fiberglass-Reinforced Polyethylene Boxes, or Other/Unknown Large Containers into Standard Waste Boxes

LANL reported large containers (greater than the volume of the SLB) for six waste streams. In order for LANL to ship these waste streams to the WIPP, it will have to "size-reduce" the waste (including the original waste containers) and directly load the size-reduced waste and containers into SWBs.<sup>3</sup> Therefore, the steel and plastic packaging densities associated with the SWBs, as described in Section D-2.4, were used.

# D-3.5 Argonne National Laboratory-East Packaging Material Densities

Argonne National Laboratory-East (ANL-E) reported a packaging configuration for waste stream AE-T009 as three 30-gallon drums overpacked in a RH-TRU waste canister (Crawford 2003a). The volume of RH-TRU waste originally reported by ANL-E is the waste volume associated with the 30-gallon drums that will be loaded into the RH-TRU waste canister, which does not reflect the volume of waste that will be disposed in WIPP. Therefore, the steel, plastic, and lead packaging material densities were recalculated based on the volume of the RH-TRU waste canister (0.89 m³). The calculation is similar to that shown in Section D-2.7 for three 55-gallon drums overpacked in an RH-TRU waste canister, except that the total weight of steel for this case was determined based on the steel packaging material density given by the site for the 30-gallon drums (124.4 kg/m³). The resulting steel packaging material density was 481 kg/m³.

- 12 -

<sup>&</sup>lt;sup>1</sup> Development of the TRUPACT-III, which will allow shipment of the SLBs to WIPP for disposal is under way. According to DOE guidance (DOE 2003), inventory estimates for the CRA-2004 allow the use of the SLB as a payload container for WIPP.

The SLBs are sometimes generically referred to as " $5 \times 5 \times 8$  boxes," where the units of measure are in feet. The SLBs are in the preliminary design stage and only preliminary specifications are available. Therefore, the volume of the  $5 \times 5 \times 8$ -foot box, 5.66 m<sup>3</sup>, was used in the routine calculation as a close approximation of the internal volume of the SLB.

<sup>&</sup>lt;sup>3</sup> Repackaging into the SLBs is not considered in the routine calculation because the SWBs are currently approved and available for this use and the SLBs are not.

Since the lead is contributed entirely by the RH-TRU waste canister, the lead packaging material density is 464 kg/m<sup>3</sup>, as calculated in Section D-2.7. The density of plastic was also given by the site (39.9 kg/m<sup>3</sup>), and this was used to determine the plastic packaging density (15 kg/m<sup>3</sup>).

The updated volume of waste that will be received at the WIPP, the corresponding waste and packaging material densities, and the radionuclide concentrations were determined and documented in *Calculation of Waste Stream Volumes, Waste and Container Material Densities, and Radionuclide Concentrations for AE-T009 at ANL-E for the Compliance Recertification Application* (Trone and Sparks 2003a). The packaging material densities for this RH-TRU waste stream were adjusted according to the results of this calculation.

# D-3.6 Argonne National Laboratory-West Packaging Material Densities

Argonne National Laboratory-West (ANL-W) reported a packaging configuration for eight waste streams as three 45-gallon drums overpacked in a RH-TRU waste canister (Crawford 2003b). The volume of RH-TRU waste originally reported by ANL-W is the waste volume associated with the 45-gallon drums that will be loaded into the RH-TRU waste canister, which does not reflect the volume of waste that will be disposed in WIPP. Therefore, the steel, plastic, and lead packaging material densities were recalculated based on the volume of the RH-TRU waste canister (0.89 m³). The calculation is similar to that shown in Section D-2.7 for three 55-gallon drums overpacked in a RH-TRU waste canister, except that the total weight of steel for this case was determined assuming the 45-gallon drums weighed 23 kg (51 lbs) each and that the mass of steel in a RH-TRU waste canister was 386 kg (851 lbs). The resulting steel packaging material density was 511 kg/m³. Since the only source of lead is the RH-TRU waste canister, the lead packaging material density is 464 kg/m³, as calculated in Section D-2.7. The density of plastic (21 kg/m³) was determined by first calculating the mass of the plastic liner for a 45-gallon drum (6.3 kg).

The updated volume of waste that will be received at the WIPP, the corresponding waste and packaging material densities, and the radionuclide concentrations were determined and documented in *Calculation of Waste Stream Volumes, Waste and Container Material Densities, and Radionuclide Concentrations for RH Waste Streams at ANL-W for the Compliance Recertification Application* (Trone and Sparks 2003b). The packaging material densities for these RH-TRU waste streams were adjusted according to the results of this calculation.

# **D-3.7** Battelle Columbus Laboratories Packaging Material Densities

Battelle Columbus Laboratories (BCL) reported 12 RH-TRU waste streams. Specifically, BCL reported that the RH-TRU waste would be packaged in 55-gallon drums, and that those drums would be configured in a five-drum pallet inside the ChemNuclear Systems (CNS) 10-160B shipping container for shipment to WIPP (Crawford 2003c). The volumes of RH-TRU waste originally reported are those associated with the 55-gallon drums that will be loaded into the CNS 10-160B package. Ultimately, the 55-gallon drums will be taken to the WIPP RH-TRU waste hot cell and placed in a RH-TRU waste canister for disposal. Therefore, the steel, plastic, and lead packaging material densities were recalculated based on the materials and volume of the RH-TRU waste canister (0.89 m³). The calculation is similar to that shown in Section D-2.7 for

three 55-gallon drums overpacked in an RH-TRU waste canister, except that the total weight of steel for this case was determined based on the steel packaging material density given by the site for the 55-gallon drums (481 kg/m³). The resulting steel packaging material density for the RH-TRU waste canister with three 55-gallon drums in it was 770 kg/m³. Since the lead is contributed entirely by the RH-TRU waste canister, the lead packaging material density is 464 kg/m³, as calculated in Section D-2.7. The density of plastic was also given by the site (24 kg/m³), and this was used to determine the plastic packaging density (17 kg/m³) based on the updated volume.

The updated volume of waste that will be received at the WIPP, the corresponding waste and packaging material densities, and the radionuclide concentrations were determined and documented in *Calculation of Waste Stream Volumes, Waste and Container Material Densities, and Radionuclide Concentrations for RH Waste Streams at BCL for the Compliance Recertification Application* (Trone and Sparks 2003c). The packaging material densities for these RH-TRU waste streams were adjusted according to the results of this calculation.

# D-3.8 Energy Technology Engineering Center Packaging Material Densities

Energy Technology Engineering Center (ETEC) reported two RH-TRU waste streams, and that the RH-TRU waste will first be packaged in 55-gallon drums, then placed in RH-TRU waste canisters for shipment to WIPP (Crawford 2003d). The volumes of RH-TRU waste in the ETEC waste streams originally reported are the waste volumes associated with the 55-gallon drums loaded into the RH-TRU waste canister. Therefore, the steel, plastic, and lead packaging material densities were recalculated based on the materials and volume of the RH-TRU waste canister (0.89 m³). The calculation is the same as that shown in Section D-2.7 for three 55-gallon drums overpacked in a RH-TRU waste canister. The resulting steel packaging material density for the RH-TRU waste canister with three 55-gallon drums in it was 525 kg/m³. Since the lead is contributed entirely by the RH-TRU waste canister, the lead packaging material density is 464 kg/m³, as calculated in Section D-2.7. The density of plastic was also given by the site (37 kg/m³), and this was used to determine the plastic packaging density (26 kg/m³).

The updated volume of waste that will be received at the WIPP, the corresponding waste and packaging material densities, and the radionuclide concentrations were determined and documented in *Calculation of Waste Stream Volumes, Waste and Container Material Densities, and Radionuclide Concentrations for ET-R1-DLR and ET-R2-D107 at ETEC for the Compliance Recertification Application* (Trone and Sparks 2003d). The packaging material densities for these RH-TRU waste streams were adjusted according to the results of this calculation.

### D-3.9 Knolls Atomic Power Laboratory Packaging Material Densities

Knolls Atomic Power Laboratory (KAPL) (Schenectady, NY) reported two RH-TRU waste streams, and that the RH-TRU waste will be packaged in 55-gallon drums and then placed in RH-TRU waste canisters for shipment to WIPP (Crawford 2003e). The volumes of RH-TRU waste in the KAPL waste streams originally reported are the waste volumes associated with the 55-gallon drums that will be loaded into the RH-TRU waste canister. Therefore, the steel, plastic, and lead packaging material densities were recalculated based on the materials and volume of the RH-TRU waste canister (0.89 m³). The calculation is similar to that shown in

Section D-2.7 for three 55-gallon drums overpacked in an RH-TRU waste canister, except that the total weight of steel for this case was determined based on the steel packaging material density given by the site for the 55-gallon drums (131 kg/m³). The resulting steel packaging material density for the RH-TRU waste canister with three 55-gallon drums in it was 525 kg/m³. Since the lead is contributed entirely by the RH-TRU canister, the lead packaging material density is 464 kg/m³, as calculated in Section D-2.7. The density of plastic was also given by the site (37 kg/m³) and used to determine the plastic packaging density (26 kg/m³).

The updated volume of waste that will be received at the WIPP, the corresponding waste and packaging material densities, and the radionuclide concentrations were determined and documented in *Calculation of Waste Stream Volumes, Waste and Container Material Densities, and Radionuclide Concentrations for KA-T001 and KA-W016 at KAPL for the Compliance Recertification Application* (Trone and Sparks 2003e). The packaging material densities for these RH-TRU waste streams were adjusted according to the results of this calculation.

# **D-3.10** Lawrence Livermore National Laboratory Packaging Material Densities

Lawrence Livermore National Laboratory (LLNL) reported three CH-TRU waste streams containing over-sized boxes. These three waste streams are currently stored in miscellaneoussized boxes that cannot be used as payload containers for shipment to and disposal in WIPP (Crawford 2003f). The volumes reported by LLNL are the waste volumes associated with the current storage configuration in various sized boxes. Therefore, acceptable shipping containers and the updated packaging material densities were needed. Each of the three waste streams will be shipped and disposed in 55-gallon drums, SWBs, and SLBs. The packaging materials reported for the 55-gallon drums did not change, since the drums did not require repackaging or overpacking. However, the miscellaneous-sized boxes require repackaging. The steel originally reported as packaging material for the waste becomes waste material after repackaging and was added to the Iron-Base Metal/Alloys category. The steel packaging associated with shipping containers was simply the steel packaging for the shipping container (either a 55-gallon drum, SWB, or SLB). The SLB is a new box that will likely be used for repackaging LLNL waste. Because the SLB is still being designed (see Section D-3.4.5) and it has no set specifications, the packaging material densities for a directly loaded SWB, as shown in Section D-2.4, were used in the routine calculation for the SLBs. Therefore, the steel packaging material density was 154 kg/m<sup>3</sup> for both SWBs and SLBs. The calculation assumed no plastic packaging for the SWBs and SLBs.

The updated volume of waste that will be received at the WIPP, the corresponding waste and packaging material densities, and the radionuclide concentrations were determined and documented in *Calculation of Waste Stream Volumes, Waste and Container Material Densities, and Radionuclide Concentrations for LL-T002, LL-T005, and LL-T034 for the Compliance Recertification Application* (Leigh and Sparks 2003). The packaging material densities for these CH-TRU waste streams were adjusted according to the results of this calculation.

### D-3.11 Paducah Gaseous Diffusion Plant Packaging Material Densities

Paducah Gaseous Diffusion Plant (PGDP) reported one CH-TRU waste stream, which will be packaged in 55-gallon drums and then be placed in SWBs for shipment to and disposal in WIPP

(Crawford 2003g). The volume of the waste in this waste stream is the waste volume associated with the 55-gallon drums that will be loaded into the SWB, which does not reflect the volume of waste that will be disposed in WIPP. Therefore, the volume of waste was recalculated in the routine calculation identified below. Because the steel and plastic packaging material densities reported by the site corresponded to the packaging configuration for four 55-gallon drums overpacked in an SWB (steel and plastic packaging material densities were reported as 212 kg/m³, and 17.5 kg/m³, respectively), they were not recalculated in the routine calculation.

The updated volume of waste that will be received at the WIPP, the corresponding waste and packaging material densities, and the radionuclide concentrations were determined and documented in *Calculation of Waste Stream Volumes, Waste and Container Material Densities, and Radionuclide Concentrations for PA-A015 at PGDP for the Compliance Recertification Application* (Trone and Sparks 2003f). The packaging material densities for these CH-waste streams were adjusted according to the results of this calculation.

### E-1.0 INTRODUCTION

This appendix consists of two tables. They provide the decayed radionuclide inventory by waste stream for waste streams included in Appendix J and Appendix K. The volumes and activities in CRA Tables E-1 and E-2 have been scaled to a full repository in accordance with the Transuranic Waste Inventory Update Report, 2003 Computational Methodology (LANL 2003). These tables are similar to the Transuranic Waste Baseline Inventory Report, Revision 3 (DOE 1996 Appendix B, Table 1). Both tables contain all 767 waste streams reported in the Transuranic Waste Baseline Inventory Database, Revision 2.1 Version 3.13 Data Version D.4.16 (LANL 2005) and the activity in each waste stream for 20 radionuclides specified in the Giambalvo letter (Giambalvo 2002). The projected volume has been scaled (using the scaling factors found in Table 3 of the main body) in each waste stream such that the sum of all waste stream volumes equals a full WIPP repository for CH and RH waste. The radionuclides have been decayed to December 31, 2001.

Cynthia Zvonar Office of Environmental Compliance, Assistant Manager CBFO Carlsbad, NM 88220

**Subject:** TRU Waste Inventory Report – 2003 Update

Dear Cindy,

In order to screen WIPP restricted waste streams from the Inventory LANL needs CBFO concurrence/guidance. We wish to have a meeting with you, Inés and members of your team to discuss these criteria. Specifically the following screening criteria obtained from the TWBIR rev. 3 and regulatory requirements must be considered:

- PCBs > 50ppm
- Dose > 1000 R/hr
- Classified
- Commercial/non-defense
- Pre- 1970 buried Pit 9 at INEEL
- Unknown waste streams
- D001, D002 or D003 waste streams
- High tritium (Beryllium containing waste streams from INEEL)
- 23 Ci/L or (2300 Ci/m<sup>3</sup>) of maximum activity level averaged over the volume of the canister.

In addition, we would like to address excess Remote Handled Waste above the allocated 7080 m<sup>3</sup> limit.

Please contact me at 628-1372 (cell: 505-706-0224) to provide a date and time that is convenient for this discussion.

Sincerely,

(SIGNATURE COPY ON FILE)

## Memorandum to File March 7, 2003

The LANL-CO Inventory Team met with the Carlsbad Field Office Recertification Staff to discuss the TRU waste streams. Categories consistent with the baseline reports were discussed, as well as the placement of questionable waste components. The two categories are "Acceptable" (Appendix P) and "Excluded" (Appendix O) wastes. Wastes categorized as excluded can be further categorized into "potential future waste streams" and "all other waste streams"

The 2003 Compliance Recertification Application will provide data on emplaced TRU waste and anticipated inventory. In the Transuranic Baseline Inventory Report there was a section that had a separate appendix denoting wastes excluded from WIPP and possible future wastes for WIPP. The LANL-CO team wanted to discuss the screening criteria that will be used for the Transuranic Waste Inventory Update Report, 2003 for these wastes.

For purposes of demonstrating compliance with the long-term disposal regulations, the WIPP performance assessment (PA) process will examine the 2003 inventory (both received and anticipated) for differences from the compliance basis (Compliance Certification Application, 1996). If different, the PA will utilize the updated values to assess the long-term behavior of the repository. The inventory data to be analyzed will include the acceptable waste streams, and the excluded – potential future waste listed in the table below.

| Screening Criteria                            | Decision Made                     |
|---|-----------------------------------|
| PCBs > 50ppm                                  | Acceptable (pending EPA - Region  |
|   | 6 approval)                       |
| Dose > 1000 R/hr                              | Excluded                          |
| Classified waste                              | Acceptable                        |
| Commercial                                    | Excluded                          |
| Non-defense waste that is likely defense, but | Acceptable (with indicating       |
| no official determination                     | explanation)                      |
| Pre-1970 buried waste                         | Excluded                          |
| Pit 9 waste at INEEL                          | Acceptable (test waste only [~120 |
|   | m <sup>3</sup> ])                 |
| Unknown waste streams                         | Excluded                          |
| D001, D002, D003 waste streams                | Acceptable (with treatment to     |
|   | remove the EPA codes)             |
| Beryllium-containing waste streams, (e.g.,    | Excluded                          |
| beryllium reflectors at INEEL)                |                                   |
| >23 Ci/L or (23,000Ci/ cubic meters)          | Excluded                          |
| of maximum activity level averaged            |                                   |
| over the volume of the canister               |                                   |
| Sodium-Bearing Waste from INEEL               | Excluded - Potential Future Waste |
|   |                                   |
| RH TRU waste > 7,080 cubic meter limit        | Excluded                          |

The team was reminded to keep in mind when scaling the RH TRU waste of the 5% limit of RH TRU between 100R/hr and 1000R/hr.

April 22, 2002

Joe Harvill, T-141, GSA-101, (234-7652) Westinghouse TRU Solutions Carlsbad, New Mexico

Subject: Sandia's WIPP Inventory Data Needs for Performance Assessment

Per your request [Harvill, 2002], this letter details Sandia's additional data needs regarding the inventory data to be included in the 2002 update to the Transuranic Waste Baseline Inventory Report (TWBIR). In order to conduct a performance assessment of the WIPP for the Compliance Recertification Application (CRA) that (1) accounts for revisions to inventory estimates since certification of the repository, (2) accounts for both currently emplaced waste and to-be-emplaced waste, and (3) is defensible against concerns regarding heterogeneous waste emplacement, we will need the 2002 update to the TWBIR to include the following inventories:

- 1. Waste stream volumes.
- 2. Inventory of radionuclides on a waste stream basis for both CH- and RH-TRU waste, decayed to a common base year. For calculating releases due to cuttings, cavings, and spallings we need inventories on a waste-stream basis for the key radionuclides (i.e. those accounting for >99% of the EPA units in the WIPP plus some of their parents and daughters) [Sanchez et al., 1997]. For the Compliance Certification Application, the key radionuclides were determined to be <sup>241</sup>Am, <sup>244</sup>Cm, <sup>238</sup>Pu, <sup>239</sup>Pu, <sup>240</sup>Pu, <sup>241</sup>Pu, <sup>233</sup>U, <sup>234</sup>U, <sup>137</sup>Cs, and <sup>90</sup>Sr [Sanchez et al., 1997]. Because Sandia will re-evaluate the determination of key radionuclides, this list may grow.

For assessing the impact of heterogeneous waste emplacement on direct brine releases, we will require inventories on a waste-stream basis for a subset of the radionuclides accounted for in the direct brine release model. The required radionuclides are <sup>241</sup>Am, <sup>243</sup>Am, <sup>244</sup>Cm, <sup>237</sup>Np, <sup>238</sup>Pu, <sup>239</sup>Pu, <sup>240</sup>Pu, <sup>241</sup>Pu, <sup>242</sup>Pu, <sup>242</sup>Pu, <sup>244</sup>Pu, <sup>229</sup>Th, <sup>230</sup>Th, <sup>232</sup>Th, <sup>234</sup>U, <sup>235</sup>U, <sup>236</sup>U, and <sup>238</sup>U.

For performance assessment calculations of direct brine release and subsurface transport of radionuclides, for determining the waste unit factor, and for re-evaluating key radionuclide determinations, we will require inventories on a WIPP-scale basis for a greater number of radionuclides. Fifteen radionuclides contribute to the waste unit factor: <sup>241</sup>Am, <sup>243</sup>Am, <sup>249</sup>Cf, <sup>251</sup>Cf, <sup>243</sup>Cm, <sup>245</sup>Cm, <sup>246</sup>Cm, <sup>247</sup>Cm, <sup>248</sup>Cm, <sup>237</sup>Np, <sup>238</sup>Pu, <sup>239</sup>Pu, <sup>240</sup>Pu, and <sup>244</sup>Pu [Sanchez, 1996]. Performance assessment models track 29 radionuclides on a WIPP-scale basis: <sup>241</sup>Am, <sup>243</sup>Am, <sup>252</sup>Cf, <sup>243</sup>Cm, <sup>244</sup>Cm, <sup>245</sup>Cm, <sup>248</sup>Cm, <sup>237</sup>Np, <sup>231</sup>Pa, <sup>210</sup>Pb, <sup>147</sup>Pm, <sup>238</sup>Pu, <sup>239</sup>Pu, <sup>240</sup>Pu, <sup>241</sup>Pu, <sup>242</sup>Pu, <sup>244</sup>Pu, <sup>226</sup>Ra, <sup>228</sup>Ra, <sup>90</sup>Sr, <sup>229</sup>Th, <sup>230</sup>Th, <sup>233</sup>Th, <sup>233</sup>U, <sup>234</sup>U, <sup>235</sup>U, <sup>236</sup>U, <sup>238</sup>U [Garner, 1996; Sanchez et al., 1997]. Re-evaluation of key radionuclides may benefit from tracking 14 additional radionuclides that per EPA regulation contribute to the number of EPA units in the WIPP: <sup>227</sup>Ac, <sup>14</sup>C, <sup>135</sup>Cs, <sup>129</sup>I, <sup>59</sup>Ni, <sup>63</sup>Ni, <sup>107</sup>Pd, <sup>79</sup>Se, <sup>151</sup>Sm, <sup>121m</sup>Sn, <sup>126</sup>Sn, <sup>99</sup>Tc, <sup>232</sup>U, and <sup>93</sup>Zr [Sanchez, 1996]. Radionuclide inventories for these purposes may be provided on a WIPP-scale basis prior to completion of the 2002 update to the TWBIR, if you wish to minimize the number of radionuclides that must be tracked on a waste stream basis, or may be provided on a waste stream basis within the update. If WIPP-scale inventories are provided prior to completion of the 2002 update to the TWBIR, the same inventories should be included in the 2002 update to the TWBIR.

In summary, please provide waste-stream level inventories of at least

$$^{241}\text{Am},\,^{243}\text{Am},\,^{244}\text{Cm},\,^{237}\text{Np},\,^{238}\text{Pu},\,^{239}\text{Pu},\,^{240}\text{Pu},\,^{241}\text{Pu},\,^{242}\text{Pu},\,^{244}\text{Pu},\,^{229}\text{Th},\\ ^{230}\text{Th},\,^{232}\text{Th},\,^{234}\text{U},\,^{235}\text{U},\,^{236}\text{U},\,^{238}\text{U},\,^{137}\text{Cs},\,\text{and}\,^{90}\text{Sr}.$$

Please provide WIPP-scale inventories of

$$^{241}Am,\ ^{243}Am,\ ^{249}Cf,\ ^{251}Cf,\ ^{252}Cf,\ ^{243}Cm,\ ^{244}Cm,\ ^{245}Cm,\ ^{246}Cm,\ ^{247}Cm,\ ^{247}Cm,\ ^{248}Cm,\ ^{137}Cs,\ ^{237}Np,\ ^{231}Pa,\ ^{210}Pb,\ ^{147}Pm,\ ^{238}Pu,\ ^{239}Pu,\ ^{240}Pu,\ ^{240}Pu,\ ^{241}Pu,\ ^{242}Pu,\ ^{244}Pu,\ ^{226}Ra,\ ^{228}Ra,\ ^{90}Sr,\ ^{229}Th,\ ^{230}Th,\ ^{232}Th,\ ^{233}U,\ ^{234}U,\ ^{235}U,\ ^{236}U,\ and\ ^{238}U.$$

✓ Consider providing WIPP-scale inventories of

$$^{227}Ac,\ ^{14}C,\ ^{135}Cs,\ ^{129}I,\ ^{59}Ni,\ ^{63}Ni,\ ^{107}Pd,\ ^{79}Se,\ ^{151}Sm,\ ^{121m}Sn,\ ^{126}Sn,\ ^{99}Tc,\ ^{232}U,\ and\ ^{93}Zr.$$

3. Inventory of all nonradioactive waste material parameters that were previously tracked in the TWBIR. These inventories should be provided on a waste stream basis for both CH- and RH-TRU waste. Nonradioactive waste material parameters include: Iron Base Metal/Alloy; Aluminum Base Metal/Alloy; Other Metal/Alloy; Other Inorganic Materials; Vitrified; Cellulosics; Rubber; Plastics; Solidified Inorganic Material; Solidified Organic Material; Cement; Soils; Steel (container material); Plastic/Liners (container material); and Lead (container material for RH-TRU waste only) [US DOE, 1996].

The Cellulosics inventory should include plywood waste boxes and other waste container materials made of cellulosics. This inventory will contribute to gas generation.

If Solidified Organic Material or Solidified Inorganic Material occurs in a waste stream, please specify what materials were used to solidify the waste, and if feasible, in what proportions. The specification can be made within the waste stream description or in a separate field. These materials may have implications for actinide solubility.

Include only portland cement (and concrete or other cements containing CaO or Ca(OH)<sub>2</sub>) in the inventory of Cement. Specify whether the partial mass density of Cement is based on unreacted (dry) cement, reacted (hydrated) cement, or a combination. Do not list portland cement inventory under Other Inorganic Material, Solidified Organic Material, Solidified Inorganic Material, or other waste material parameter. Cement may affect the pH of WIPP brines.

If Vitrified, Solidified Inorganic Material, Solidified Organic Material, or Cement is expected to occur in the final waste form and final waste form inventory data is not yet available, please estimate the partial densities of these waste material parameters that will occur in the final waste form. Appendix B-7 in the TWBIR Rev. 3 [US DOE, 1996] provides an example of how final waste form partial densities may be estimated.

If possible, specify whether a waste stream contains pyrochemical salts, and whether the pyrochemical salts resulted from Direct Oxygen Reduction (DOR) or  $O_2$  sparging. The specification can be made within the waste stream description or in a separate field. This information may have implications for actinide oxidation state.

- 4. Inventory of any other nonradioactive waste materials that are discovered to account for a significant portion of a waste stream as a result of changes to the inventory. We suggest that inventory should be taken for any material not included in the existing waste material parameters and accounting for >5% by weight or volume of a waste stream. These inventories, if they exist, should be provided on a waste stream basis for both CH- and RH-TRU waste.
- 5. Inventory of Cellulosics, Plastics, Rubbers, and other biodegradable materials used to facilitate emplacement of waste and MgO in the WIPP. Waste and MgO emplacement in the WIPP is facilitated by the use of plastic shrinkwrap, cardboard stabilizers, and other materials. Inventory estimates for these materials should be included on a WIPP-scale basis. These materials may contribute to gas generation.
- 6. Inventory of organic ligands and of SO<sub>4</sub>, NO<sub>3</sub>, and PO<sub>4</sub>. We understand from informal conversations with you and members of your team that new estimates of organic ligand concentrations and of SO<sub>4</sub>, NO<sub>3</sub>, and PO<sub>4</sub> concentrations would not improve upon the estimates available in the TWBIR Rev. 3. Therefore, for waste streams included in the TWBIR Rev 3. (and similar waste streams), we do not need updated inventories of these waste components to be included in the 2002 update to the TWBIR.

If organic ligands (acetate, citrate, oxalate, or EDTA), SO<sub>4</sub>, NO<sub>3</sub>, or PO<sub>4</sub> will be added to new waste streams during environmental restoration, decontamination and decommissioning, or similar activities, include inventory estimates for these waste components in the new waste streams. These components may affect actinide solubility or gas generation rates.

The 2002 update to the TWBIR should have the following characteristics:

- 1. Waste-stream level inventories of radionuclides and nonradioactive waste material parameters for waste currently emplaced in the WIPP should be included. The currently emplaced inventory should be distinct from the inventory remaining at waste generator sites. Inventories supplied by the waste generator sites should not include waste already sent to the WIPP.
- Waste-stream level inventories of radionuclides and nonradioactive waste material
  parameters supplied by the waste generator sites should include estimates for (1)
  stored inventory, (2) projected inventory, (3) stored plus projected inventory
  (anticipated inventory), and (4) inventory scaled to fill the WIPP (disposal
  inventory). A definition for each type of inventory is given in the TWBIR Rev. 3 [US
  DOE, 1996].
- 3. To the extent possible, the waste streams identified in the 2002 update to the TWBIR should remain the same as the waste streams identified in previous versions of the TWBIR. Such consistency will (1) ensure that inventory data is available at the level of detail required for performance assessment calculations, and (2) allow us to continue to reference previous versions of the TWBIR for any information not collected for the 2002 update.

In order for the 2002 update to the TWBIR to be fully incorporated into CRA performance assessment calculations, we will need to receive it by your proposed deadline of the end of October, 2002. If any of the preliminary assessments of inventory issues that we carry out prior to October, 2002 indicate a need for additional or more specific data, we will notify you immediately in writing.

Sincerely,

Dr. Emily R. Giambalvo (Senior Member of Technical Staff)

Dr. Emily R. Giambalvo Senior Member of Technical Staff Sandia National Laboratories Performance Assessment and Decision Analysis Dept. 6821

June 10, 2002

Joe Harvill, T-141, GSA-101, (234-7652) Westinghouse TRU Solutions Carlsbad, New Mexico

Subject: Waste Inventory: Level of Detail Required for Performance Assessment

At the April 22, 2002 meeting between Westinghouse TRU Solutions and Sandia National Laboratories regarding Sandia's waste inventory needs for performance assessment (Giambalvo, 2002), you indicated that:

- The waste categories included in the 2002 update to the Transuranic Waste Baseline Inventory Report
  (TWBIR) would be more coarsely defined than were the waste streams included in the TWBIR
  Revisions 2 and 3. This coarsening would decrease the number of waste categories from ~970
  contact-handled (CH-) and remote-handled (RH-) transuranic (TRU) waste streams to <200 CH- and
  RH-TRU waste categories.</li>
- As planned, the 2002 update to the TWBIR will account for all of the waste currently emplaced in WIPP in a single waste category. No significant difficulty would arise from categorizing the emplaced waste by waste stream or other waste category that could capture the heterogeneity of the emplaced waste.

In subsequent informal conversations, you indicated that the waste categories included in the 2002 update to the TWBIR are likely to remain very similar to the waste streams in Revisions 2 and 3 of the TWBIR due to the way in which the generator sites categorize the waste.

This letter is intended to clarify Sandia's needs regarding categorization of waste. The points listed below, where different from those listed in my letter to you of April 22, 2002 (Giambalvo 2002), supercede the points made in the previous letter.

- A probabilistic Performance Assessment (PA) can be carried out with a lesser number of waste categories than were provided by the waste stream classification in Revisions 2 and 3 of the TWBIR. Using a very small number of waste categories may lead to PA results being questioned by the regulator and/or stakeholders.
- If the waste categories used in the 2002 update to the TWBIR are not the same as the waste streams defined in Revisions 2 and 3 of the TWBIR (plus any new waste streams), then we prefer that
  - a) the waste categories be called something other than "waste streams,"
  - the 2002 update to the TWBIR include a description of how the new waste categories relate to the old waste streams, and

Exceptional Service in the National Interest

- 2 of 2 -

 the 2002 update to the TWBIR include a justification for the change in waste categorization method.

These conditions are required so that Sandia may explain to the regulator the associated differences in PA calculations, and so that we may continue to reference Revisions 2 and 3 of the TWBIR for any information not collected for the 2002 update to the TWBIR.

3. The emplaced waste inventory should be provided with the same level of detail that is provided for the waste remaining at the generator sites (to-be-emplaced waste). If to-be-emplaced waste is categorized by waste stream, then the emplaced inventory should be categorized by waste stream. If to-be-emplaced waste is more coarsely categorized, then the emplaced inventory should be categorized with a similar resolution of detail. For instance, the emplaced waste could be categorized according to final waste form (US DOE, 1996), waste matrix group (Strum, 2002), or other characteristic consistent with the categorization scheme used for the to-be-emplaced waste.

As you gather information for the 2002 update to the TWBIR, please let me know if any of the requests made in this letter or in the letter dated April 22, 2002 (Giambalvo, 2002) cannot be fulfilled.

Sincerely,

Emily R. Giambalvo

March 12, 2003

Dr. Beverly Crawford Los Alamos National Laboratories Carlsbad Office 115 N. Main St. Carlsbad, NM 88220

Subject: Clarification of Requirements for the Transuranic Waste Baseline Inventory Database Revision 2.1 from the Giambalvo Letter dated April 22, 2002

Dear Dr. Crawford:

The stated reference (Giambalvo 2003a) includes the following description of requirements for the Transuranic Waste Baseline Inventory Database Revision 2.1.

"Waste-stream level inventories of radionuclides and nonradioactive waste material parameters supplied by the waste generator sites should include estimates for (1) stored inventory, (2) projected inventory, (3) stored plus projected inventory (anticipated inventory, and (4) inventory scaled to fill the WIPP (disposal inventory). A definition for each type of inventory is given in the TWBIR Rev. 3 [US DOE, 1996]."

The purpose of this letter is to clarify the application of this statement to the waste material parameter data for individual waste streams supplied by the waste generator site. For the performance assessment calculations that will be performed in support of the Compliance Recertification Application, Sandia National Laboratories needs to know the average density of the waste material parameters throughout the repository assuming that waste material parameters are distributed homogenously throughout the repository. That value should be calculated as follows:

Exceptional Service in the National Interest

Dr. Beverly Crawford

-2-

March 12, 2003

$${}^{\text{wmp}}\rho_{\text{ave Rep}} = \sum {}^{\text{wmP}}\rho_{\text{ave }i} \cdot (v_p + v_s + v_e) / (V_p + V_s + V_e)$$
 (1)

Where

v is the projected volume for waste stream i,

v. is the stored volume for waste stream i,

v is the emplaced volume for waste stream i,

V<sub>n</sub> is the total projected volume

V is the total stored volume

is the total emplaced volume

 $_{\text{was}}^{\text{posse}}$   $\rho_{\text{ave Rep}}$  is the average density of a WMP throughout the repository

wm ρ<sub>swi</sub> is the average density of a WMP in waste stream i

None of the values in Equation 1 should be "scaled" values. This is the average density that will accommodate calculation of gas generation in our repository models.

Please note this clarification and proceed with implementation of Equation 1 for repository waste material parameter density in the TWBID Revision 2.1

If you have any questions or comments regarding this information, please contact Christi Leigh at 234-0038.

Sincerely,

Christi Leigh

# APPENDIX I WASTE STREAM PROFILES – NON-WIPP

The following waste stream profiles contain information on waste streams that were not compliant with the Contact-Handled Transuranic Waste Acceptance Criteria for the Waste Isolation Pilot Plant (CH-WAC; DOE 2000) as of the inventory date, September 30, 2002. The following waste stream profiles contain information on waste streams that are not being considered for shipment to WIPP at this time due to content, radiological composition, or lack of information about the waste streams. Appendix F contains a memo that lists the limiting conditions (screening criteria) that were used to screen these waste streams out of the inventory. The TRU waste sites that have reported non-WIPP waste streams are:

| 1.  | Argonne National Laboratory – West                      | AW |
|-----|---|----|
| 2.  | Babcock and Wilcox, Lynchburg                           | BL |
| 3.  | Framatome (Richland)                                    | FR |
| 4.  | General Electric Vallecitos Nuclear Center              | GE |
| 5.  | Idaho National Engineering and Environmental Laboratory | IN |
| 6.  | Knolls Atomic Power Laboratory – Nuclear Fuels Service  | KN |

#### **Waste Stream Description**

Sodium is used as a primary and was used as a secondary coolant for the EBR-II reactor. Waste sodium metal is a hazardous constituent of some of the TRU waste stored at the ANL-W Radioactive Scrap and Waste Facility (RSWF). The waste is generated during maintenance and operational activities. The sodium typically coats waste metal equipment, experiments, and components removed during reactor operations and maintenance activities or is contained in blanket elements. This waste will require treatment prior to disposal at WIPP. Final waste form has not been determined yet.

#### **Waste Stream Description**

Waste Stream ID:

AW-W019

Sodium potassium alloy (NaK) is used as a coolant for some components of the EBR-II Reactor. Waste NaK metal is a hazardous constituent of some transuranic wastes stored at the ANL-W Radioactive Scrap and Waste Facility (RSWF). The remote-handled NaK waste at RSWF is contained in stainless steel capsules or tubing and placed inside carbon steel waste cans which then are placed in stainless steel outer cans. The entire package is then stored in RSWF storage liners (carbon steel soil storage vaults). The NaK is generated during maintenance and operational activities. NaK waste is in canisters with TRU waste metal pieces and rods from reactor experiments. This waste will require treatment prior to disposal at WIPP. Final waste form has not been determined yet.

#### **Waste Stream Description**

This waste is from the D&D of a Mixed Oxide fuel fabrication plant. Wastes consist of discarded equipment (motors, grinders, scales, etc.) and decontamination wastes (rags, protective clothing, sweeps, etc.) from the D&D of the facility.

#### **Management Comments**

Waste will be accepted into the Hanford TRU Program and characterized to meet all certification requirements for shipment to WIPP.

#### **Waste Stream Description**

The liquid SBW would be transferred from the storage tanks to the calcine process over a 2.5-year period. The calciner is a fluidized bed reactor that converts the metals dissolved in the nitric acid into a dry granular powder. The fluidized bed operates at temperature between 550 and 600 degrees centigrade. The SBW feed to the calcine process would be mixed with aluminum nitrate and calcium nitrate, to tie up sodium and potassium and fluoride in the fluidized bed. The calcine would be removed pneumatically from the fluidized bed and transferred to the canning facility and placed in to 72-B canisters. The calciner off-gas is scrubbed with nitric acid to cool and remove fine calcine, mercury and chlorides from the off-gas. The off-gas would then pass through HEPA filters. The calcine would be RH-TRU waste, dried to 1% moisture, and would generate approximately 1375 canisters with a surface dose rate <100 Rem/hr.

1100.0

1100.0

This treatment option was selected to be input into the 2002 update to the TWBIR, since only one option can be input. This is the bounding case for RH-TRU. Inventory will be adjusted accordingly when final option is determined.

#### **Management Comments**

The total inventory figures as to the waste volume and number of containers is based on preliminary process design calculation and could changes as the waste is retrieved and treated to a final waste form. Retrieval of the waste from the storage tanks, treatment, and shipping is planned to start in 2009 and be completed in 2012.

The calcine generated by the SBW Calcine/MACT Treatment Process would generate approximately 1375 72-B canisters with a surface dose rate of 50 Rem/hr. Calcine is a dry granular product.

#### **Waste Stream Description**

The liquid SBW would be transferred from the storage tanks to the calcine process over a 2.5-year period. The calciner is a fluidized bed reactor that converts the metals dissolved in the nitric acid into a dry granular powder. The fluidized bed operates at temperature between 550 and 600 degrees centigrade. The SBW feed to the calcine process would be mixed with aluminum nitrate and calcium nitrate, to tie up sodium and potassium and fluoride in the fluidized bed. The calcine would be removed pneumatically from the fluidized bed and transferred to the canning facility and placed in to 72-B canisters. The calciner off-gas is scrubbed with nitric acid to cool and remove fine calcine, mercury and chlorides from the off-gas. The scrubber blowdown would be grouted with 14 wt % Ca(OH)2, 9 wt % blast furnace slag and 7 wt % Portland cement. The grout would contain 30% moisture and packaged in RH-canister and generate approximately 38 canisters with a surface dose rate <100 Rem/hr.

#### **Management Comments**

The total inventory figures as to the waste volume and number of containers is based on preliminary process design calculation and could changes as the waste is retrieved and treated to a final waste form. Retrieval of the waste from the storage tanks, treatment, and shipping is planned to start in 2009 and be completed in 2012.

Grouted Scrub waste stream will generate approximately 38 canisters with a surface dose rate <100 Rem/hr.

#### **Waste Stream Description**

This waste stream consists of beryllium reflector blocks and outer shim control cylinders (OSCCs) removed from the Advanced Test Reactor (ATR) at INEEL.

#### **Management Comments**

This is a new waste stream and was not included in the previous Transuranic Waste Baseline Inventory Report submittal.

#### **Waste Stream Description**

The waste stream was sludge generated from four catch tanks that were removed from service. The sludge was generated from activity in the TRA Hot Cell and the TRA Chemistry Laboratories. This was generated only "one time."

Packaging Material, Lead

Packaging Material, Steel Plug

#### **Management Comments**

Contact radiation readings range from 800 mR/hr to 5000 mR/hr.

#### **Waste Stream Description**

This waste stream, generated at Mound Laboratory, consists of dry evaporator and dissolver sludge and insoluble residue. The consistency ranges from powder to sand-like particles. Limited amounts of other noncombustible wastes including Content Codes 803, 805, 810, 813, 814, 826, and 832 may be included. A few containers may have limited amounts of beryllium-contaminated wastes including glass, paper, gloves, and sample precipitates.

Packaging Material, Steel Plug

0.00

There is a potential for and lack of information on fines. In addition the drums may contain free liquids. The expected organic content in the drums is less than 14lb/ft3. No explosive, pyrophoric, or corrosive materials should be in the waste.

After removal from the bottom of dissolver pots, the dried sludge is rinsed with nitric acid and dried on a hotplate. Dried sludges are packaged in 1/2-gallon metal cans and sealed in a PE bag, or else packed in 1/2-gallon plastic-coated cardboard cartons and sealed in a PE bag. Each container is assayed and placed in PVC or PE sleeve bags. Sleeve bags can hold up to 5 containers per bag. Up to 8 sleeve bags are placed in each prepared 55-gallon drum. Drums are prepared according to post-1972 procedures, with plywood spacers as needed between on top of the rigid drum liner lid.

#### **Management Comments**

Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.

#### **Waste Stream Description**

This wastestream, which was generated at ANL-W was generated during analytical chemistry and metallography operations. Item Description Code (IDC) 153 was replaced by IDC 160, ANL-W HFEF Analytical Chemistry and Metallographic Combsutibles. The waste package contains lead as shielding.

#### **Management Comments**

Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.

#### **Waste Stream Description**

There is no descriptive or constituent information available for this waste, which was generated at ANL-E.

#### **Management Comments**

Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.

Original data showed 1 SWB. Int. volume and # stored changed to more accurately reflect the waste volume of 0.5 m3 as follows: .5 m3 / .208 m3 / drum = 2.404 drums, rounded to 3 drums. Tb 3/27/03.

#### **Waste Stream Description**

This waste stream is from Bettis Atomic Power Laboratory. It consists of a single drum of TRU. No more information is available, but the waste is thought to be solidified inorganic solutions.

#### **Management Comments**

Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.

#### **Waste Stream Description**

There is no descriptive or constituent information available for this waste, which was generated at Bettis Atomic Power Laboratory.

#### **Management Comments**

Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads and examination of waste by real time radiography will begin in the next 1 - 2 years.

Packaging Material, Lead
Packaging Material, Steel Plug

0.00

0.00

Original data showed 1 SWB. Int. volume and # stored changed to more accurately reflect the waste volume of 0.5 m3 as follows: .5 m3 / .208 m3 / drum = 2.404 drums, rounded to 3 drums. Tb 3/27/03.

#### **Waste Stream Description**

This waste stream is the remaining sludge left as undefined sludge from the original IN-Z001 waste stream.

Final Form Total

#### **Management Comments**

Since this sludge is undefined, its characteristics are unknown and will remain in this waste stream until further information is known about this sludge.

#### **Waste Stream Description**

The INEEL disposed of 2.562 m3 of highly active irradiated beryllium reflector waste in the Radioactive Waste Management Complex (RWMC) Subsurface Disposal Area (SDA) between 1970 and 1993. It originated from the Advanced Test Reactor, the Engineering Test Reactor, and

the Materials Test Reactor at INEEL and was buried in trenches and soil vault rows at the SDA. This TRU waste will be retrieved in accordance with the Settlement Agreement of 1995, the Record of Decision in 1998, and the U.S. District Court ruling of April 1, 2003. The

treatment methods, if any, and the final form of the waste are yet to be determined. For planning purposes, it is assumed that the final form of this TRU waste (2.562 m3) will have an activity of at least 100 nCi/g and will, therefore, be eligible for disposal/storage at WIPP, from a minimum concentration requirement. (In fact, the activity is high enough that it is expected to require remote handling.) The volume of material shown in this profile represents only the waste. It does not include any contaminated soil that may meet the 100 nCi/g criterion, making it eligible for disposal/storage at WIPP also. Since no soil is included in the volume, there is also no dilution of high activity concentrations. For performance assessment purposes, it is suggested that decay be initiated on January 1, 1994.

#### **Waste Stream Description**

This waste is non-hazardous debris and soil from Building 234. The debris consists of metal chips/shavings, dust, cheesecloth, gloves, and plastic bottles from the cleanout of the shear baler used to decommission process equipment and glove boxes. It also includes rubber gasket material used to install glove boxes.

Packaging Material, Steel Plug

## **Waste Stream Description**

This waste form is vermiculte with absorbed organic liquid.

## **Management Comments**

New Waste Stream being added to TWBIR. This waste is packaged in a 55 gallon carbon steel drum.

| Cement (Solidified)            | 0.00                          |
| Vitrified                      | 0.00                          |
| Solidified, Organic Matrix     | 0.00                          |
| Soils                          | 0.00                          |
| Packaging Material, Steel      | 0.00                          |
| Packaging Material, Plastic    | 0.00                          |
| Packaging Material, Lead       | 0.00                          |
| Packaging Material, Steel Plug | 0.00                          |

No Final Form **Radionuclides Provided** 

#### **Waste Stream Description**

Polymerized aqueous - small cans consists of small quantities of aqueous liquids solidified with polymer such as Nochar A-660.

## **Waste Stream Description**

"Magnesium oxide sand used as an insulating material in the annulus between the magnesium oxide crucible and the reaction vessel wall. Following the reduction of plutonium tetrafluoride to plutonium metal, the sand was screened from the slag and crucible material."

## **Management Comments**

Waste Stream currently exists in the TWBIR as a residue, (i.e., RF-TRXXXX), but is being revised to transuranic, (i.e., RF-TTXXXX).

## **Waste Stream Description**

THE STREAM CONTAINS PLASTIC/POLYURETHANE, STAINLESS STEEL, PAPER/CARDBOARD, RUBBER, LEAD, CLOTH/RAGS/NYLON.

## **Management Comments**

The assumption is that the WIPP No Migration Petition will be approved by EPA and the State of New Mexico. Under the assumption, treatment of the waste stream to meet LDR is not required nor planned.

## Waste Stream Description

ContainerType

Box

Typically, 70 to 80% of the waste in the drums is combustible items such as wood, plastics, paper, absorbents, rubber and rags. Approximately 20 to 30% of the waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing fixtures and soil. Boxes typically contain whole and sectioned glove boxes, hoods, conduit, lathes, pumps, fans, light fixtures, tools conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oil have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms.

## **Waste Stream Description**

THE STREAM CONTAINS METAL/IRON/GALVANIZED/SHEET, PLASTIC/POLYURETHANE, CONWEB PADS, DIRT/SOIL/DIATOMACEOUS EARTH.

#### **Management Comments**

The assumption is that the WIPP No Migration Petition will be approved by EPA and the State of New Mexico. Under the assumption, treatment of the waste stream to meet LDR is not required nor planned.

Packaging Material, Lead

Packaging Material, Steel Plug

#### **Waste Stream Description**

The waste is generated from Facility/Equipment Operation and Maintenance Waste activities at the POST IRRADIATION TEST LABORATORY.

## **Management Comments**

n the interim state, the waste stream consists of 33 containers, 31 of which have an internal container volume of 0.0126 m3. The container with the largest internal volume of 0.25 m3 holds highly enriched uranium oxides. The waste material is irradiated fuel element segments from LANL. It was repackaged at the 327 Building prior to shipment for storage as TRU waste. The U235 content is 50% by weight.

#### **Waste Stream Description**

This waste stream is defense related, contact handled TRU and is a neutralized aqueous stream in an inorganic sorbent.

## **Management Comments**

Approximately 45 55-gallon drums per year will be produced. The inorganic sorbent will contain 15 grams of Pu and 15 grams of HEU. The distribution of the Pu is Pu239 – 90 to 95%, Pu240- 5 to 9%, Pu241- <1%, Pu242- <.1%, and Pu238- <.5%. The uranium distribution is U235- 93%, U238- 5.4%, U236- .5%, and U234- 1%. The TRUCON codes have not yet been assigned.

Delta between Total # Projected and 45/yr for 16 yrs (720) is because Total # Projected was calculated from given volume and 45/yr was from given comment. Tbrown 3/22/03

### **Waste Stream Description**

This waste stream is defense related, contact handled TRU and is composed of heterogeneous debris which can include HEPA filters, plastic, protective clothing, metal, gloves, lead lined gloves and sludges.

Packaging Material, Lead

Packaging Material, Steel Plug

### **Management Comments**

Delta between Total # Projected and 800/yr for 16 yrs (12800) is because Total # Projected was calculated from given volume and 800/yr was from given comment. Tbrown 3/22/03

### **Waste Stream Description**

This waste stream is defense related, contact handled TRU and is composed of heterogeneous debris which can include HEPA filters, plastic, protective clothing, metal ingots including beryllium, gloves, lead lined gloves and sludges.

### **Management Comments**

The TRUCON and EPA codes have not yet been assigned.

Delta between Total # Projected and 680/yr for 13 yrs (8840) is because Total # Projected was calculated from given volume and 680/yr was from given comment. Tbrown 3/22/03

### **Waste Stream Description**

This waste stream consists of filters generated from normal site operations. The specific contents include pre-filters, High Efficiency Particulate Air (HEPA) filters, and roughing filters.

#### **Waste Stream Description**

This waste stream consists of uncharacterized (i.e., requires hazardous characterization) general site waste generated from normal site operations. The specific contents of this waste stream are unknown.

#### **Management Comments**

WVNS Container ID #s for this waste stream are: 5046, 5047, 5069, 5099, 5153, 5253, 5263, 5304, 5321, 5334, 5348, 5382, 5563, 5856, 6310, TD-008, TD-017, TD-028, TD-034, TD-035, TD-040, TD-043, TD-184, TD-240, TD-268, TD-271, TD-294, TD-304, TD-304, TD-307, TD-387, TD-389, TD-399, TD-402, TD-407, TD-546, TD-554, TD-581, TD-596, TD-606, TD-607, TD-622, TD-634, TD-924, TD-926, TD-931, TD-432, TD-537, 6503.

#### **Waste Stream Description**

This waste stream consists of sweeping compound generated from normal site operations. The specific contents include grid and floor debris. This waste stream is considered as hazardous/radioactively contaminated based on the assumption that the waste contains lead and chromium contaminated paint chips.

#### **Waste Stream Description**

This waste stream was generated as a result of the decommissioning and decontamination of the Chemical Process Cell (CPC). The CPC was previously used to reprocess spent fuel rods. The specific contents of this container include vacuum lines, air lines, floor debris, pipe, & hoses.

Packaging Material, Lead

Packaging Material, Steel Plug

465.00 0.00

#### **Management Comments**

WVNS container ID's for these boxes: TC-172, TD-173, TD-174, TD-175, 3E-1/7E-5/7E-8

A portion of this waste stream will be repackaged into 55-gallon drums.

#### **Waste Stream Description**

This waste stream consists of radiologically and hazardous glove boxes generated from decommissioning and decontamination activities. The specific contents include glove boxes and tools.

#### **Management Comments**

WVNS Container ID number is TD-370, TC-191, TC-192, TC-194.

Waste will be size reduced and repackaged into 55-gallon drums at a future date.

#### **Waste Stream Description**

This waste stream was generated as a result of the decommissioning and decontamination of the Chemical Process Cell. The specific contents of these containers include evaporators, dissolvers, tanks, condensers, etc. These vessels were previously used to reprocess spent fuel rods.

#### **Waste Stream Description**

This waste stream was generated as a result of the decommissioning and decontamination of the Chemical Process Cell (CPC). The specific contents of these containers include various jumpers and miscellaneous equipment, etc. The CPC was previously used to reprocess spent fuel rods.

Packaging Material, Steel Plug

#### **Management Comments**

Jumper Boxes J1 Through J-12 Each jumper box is 432 cubic feet and contains a inner container which houses the jumpers and misc. waste

These containers will be size reduced and repackaged into 55-gallon drums at a later date.

#### **Waste Stream Description**

This waste stream consists of spent filter media generated from filtration of the Fuel Receiving & Storage pool where the remaining spent fuel rods are stored.

#### **Management Comments**

HIC-A 1, 80 cubic foot High Integrity Container

HIC filter media will be repackaged into 55-gallon drums at a later date.

#### **Waste Stream Description**

This waste stream consists of debris generated as a result of decommisioning and decontaminating of head end cells. These cells were used to prep the fuel for reprocessing. Waste from the waste tank farm is also included.

#### **Waste Stream Description**

This waste stream consists of transuranic lead in the following configurations: lead bricks and lead shielding. Note: The size of the waste stream components may be highly variable. In addition to the lead materials listed above, the following wastes are also part of the containers included in this waste stream: glassware, bags, bottles. oven, ultrasonic chiller, and an old style 8D-2 sample cask. The wastes included in this stream are characterized as mixed because they exhibit the characteristic of toxicity for lead.

#### **Management Comments**

WVNS Container ID #s for this waste stream are: TC-135D, TC-136, TC-193, TD-1070, TD-1168, TD-1228, TD-1232, TD-1259, TD-1282, TD-1316, TD-1361.

# APPENDIX J WASTE STREAM PROFILES – WIPP

The following waste stream profiles contain information on waste streams that are being considered for shipment to WIPP at this time and are expected to meet the Contact-Handled Transuranic Waste Acceptance Criteria for the Waste Isolation Pilot Plant (CH-WAC; DOE 2002) as of the inventory date, September 30, 2002. The TRU waste sites that have reported WIPP waste streams are:

| Argonne National Laboratory – East                      | AE |

#### **Waste Stream Description**

Solidified inorganic liquid waste from evaporator bottom. Waste stream identifiers previously referred to as AE-W038, AE-W039 and AE-W040 are now included with waste stream AE-T001.

#### **Management Comments**

Waste stream identifiers previously referred to as AE-W038, AE-W039 and AE-W040 are now included with waste stream AE-T001.

TB assumed all projected waste will be in 55 gallon drums.

#### **Waste Stream Description**

Paint scraping debris from analytical lab hot cell refurbishment.

#### **Management Comments**

This is a TRU waste packaged to meet the WIPP WAC. Particulate materials were solidified for immobilization.

## Waste Stream ID: AW-N027.531

#### **Waste Stream Description**

Transuranic waste generated from plutonium casting laboratory (PCL) and Analytical laboratory (AL) Hot cell operations. This waste is typically packged in 55-gallon drums.

#### **Management Comments**

#### **Waste Stream Description**

This waste stream consists of chloride salts containing residual amounts of cadmium and barium. This waste stream will be generated from the Fuel Conditioning Facility operations as a result of decommissioning the electrorefining equipment. The cadmium pool will be pumped out of the MK-IV electrorefiner using the bulk fluid handling system. It will be treated with the most economical and technically sound available process for treating hazardous metals. The two technologies currently being considered are amalgamation and encapsulation. Amalgamation involves mixing the cadmium with another metal. Encapsulation involves covering the solid cadmium with a layer of plastic. Research and development on one or both of these processes will be done during the inventory reduction phase of spent fuel treatment. If other more promising technologies are proposed in the near future, they will also be considered. The final destination for this waste should be WIPP if the RH canister container can meet the RH radiation limitations of <100 R/hr at contact.

#### **Waste Stream Description**

This waste stream consisted of metallic cadmium, salts, and associated cleanup materials (paper towels and cloth rags). The waste is contaminated with activation and fission products as well as with plutonium. This waste stream is generated for Fuel Conditioning Facility Demonstration support experiments; the analysis of fuels in the hot cells.

18.7

Soils

Packaging Material, Steel

Packaging Material, Lead

Packaging Material, Plastic

Packaging Material, Steel Plug

Previous waste is stored in the Radioactive Scrap and Waste Facility in two liners. Future waste generation will be small because evaporation as part of the process will be done in the hot cell to minimize the volume.

#### **Waste Stream Description**

Drum / Metal

Waste packaged for WIPP containing: Radioactive cadmium debris from CH-ANL-242T, solidified to meet WIPP-WAC requirement for particulate immobilization, and bags of lead-lined gloves were placed in the solidified CO2 drums to fill the void spaces. The leftover gloves were placed in a separate 30 gallon drum. 1710 lbs of waste are in two TRU Pac containers: MW-S-94-02 AND MW-S-94

#### **Management Comments**

Additional Source - Other Decontamination Waste.

#### Waste Stream ID: AW-W028

#### **Waste Stream Description**

This waste stream consists of metal or wook framed filters. Filters are 2'x2'x0.5'. The filters have screen mesh covering high efficiency filtering media. The concentration of radioisotopes and RCRA metals varies in each filter. These filters were generated from the decontamination of the analytical hot cells in 1993 and 1994.

#### **Waste Stream Description**

The filters consist of two types. One is a depth filter made entirely of polypropylene. The other is a pleated filter made up of a glass fiber filter media with polyester support. This media is housed in a polypro; ylene cage with silicone O-rings. The filters are used primarily for the removal of cadmium. However, they also remove uranium and plutonium.

#### **Waste Stream Description**

As-Generated Volumes ContainerType

RH Canister used to overpack 45 gallon drums

The crucible waste stream in the Fuel Conditioning Facility (FCF) has been characterized as TRU waste. Presently, three 45 gallon RH-TRU containers are filled with crushed crucible material, and are awaiting shipment to the radioactive scrap and waste facility (RSWF). Befor crushing, crucibles are cleaned below their clean tare weight. Based on samples taken on crushed crucible material, there are only a few tenths of grams of fissile material (u-235 or Pu-239 present per crucible disposed.

### **Waste Stream Description**

JN-4 D&D Debris Waste consists of heterogeneous debris waste generated by the activities conducted in Building JN-4. The waste includes paper, plastic, rubber, paint chips, crushed metal cans, prefilters, glass, concrete, grout, lead shot, and miscellaneous laboratory equipment

### **Management Comments**

TB @ LANL assumed M-111 bins repackaged into SWBs since volumes are the same. This allows us to capture the volume for PA puposes. Understand this is not a commitment by BCL.

### Waste Stream ID: BCLRH-MT01

### **Waste Stream Description**

Hazardous organic debris consists of the materials generated during repackaging of the waste materials generated from research and development activities conducted in Building JN-1. This waste consists primarily of iron based metals, paper, plastic, cloth, aluminum, cellulosics, rubber, and lead items (bricks, shot, apron, and gloves).

### **Waste Stream Description**

Pool Water Filter Resin consists of ion-exchange resin (nuclear grade), which was used for deionizing the Transfer/Storage Pool water. The CM-2 Regenerated Mixed Bed Resin used was contained in muslin bags (cotton bags). The matrix will also include Floor Dry (diatomaceous earth) used as an absorbent during the original packaging of this waste and 10 lbs. of absorbent (50:50 Floor Dry and Radsorb) added during repackaging to absorb any water from condensation or dewatering

### **Waste Stream Description**

ContainerType

RH Canister

Pool Water Prefilters and Debris consists of the cartridge prefilters and debris generated during the change-out of resin used for filtering the Transfer/Storage Pool water. The filter matrix is composed f glass and cellulose fibers combined with melamine resin. The end caps are polypropylene and the filters are placed in the canisters with rubber gaskets (butyl/nitrile). Other debris that may be present from the original packaging may include paper (blotter paper and Floor Dry bags), plastic liners, rubber gaskets, muslin resin bags, rubber gloves, and other miscellaneous plastic, cellulosics, and metal materials. The waste matrix will also include Floor Dry and Radsorb added during repackaging to absorb any water from condensation or dewatering.

#### **Waste Stream Description**

Organic Debris consists of the materials generated during repackaging of the waste materials generated from research and development activities conducted in Building JN-1. This waste consists primarily of rubber debris material including polyethylene, polyvinyl chloride, nylon, Styrofoam, Tygon, plexiglass, and neoprene. Wood debris with no signs of hazardous waste contamination may also be included. Waste items may include non-deteriorated sheeting, hose/tubing, respirators, boots, rain suits, o-rings, electrical cords, safety glasses, plexiglass panels, plywood, and pallets. The waste matrix will also include Floor Dry and Radsorb added during repackaging to absorb any water from condensation or dewatering

### **Waste Stream Description**

Inorganic Debris consists of glass and metal debris generated during repackaging of the waste materials generated from research and development activities conducted in Building JN-1. Glass debris includes laboratory glassware, windows, and various glass apparatus. Metal debris may include deteriorated berry cans, cable wire, planchets, sign, valves, piping, strapping, tools, foil, sheeting, fixtures, equipment, hardware, fuel rod cladding, and Metmounts (sectioned metal material embedded in a plastic matrix). Metals of construction include stainless steel, aluminum, iron, copper, beryllium, and zirconium alloy (Zr-2, Zr-4). The waste matrix will also include Floor Dry and Radsorb added during repackaging to absorb any water from condensation or dewatering.

### **Waste Stream Description**

Tri-Nuc Filters consists of filter cartridges used in the underwater vacuum system for cleaning the surfaces and filtering the water of the Transfer/Storage Pool. The cartridges are 30" long and 6" in diameter and consist of media enclosed within a stainless steel screen shroud, and aluminum screen reinforced plastisol end caps. The filter media is composed of polypropylene, melt brown reinforced typar, and is available in 0.3, 1, 5, 10, and 20-micron mesh sizes. The waste matrix will also include Floor Dry (diatomaceous earth) and Radsorb (50:50 mix) added to each liner.

Packaging Material, Steel Plug

#### **Waste Stream Description**

Slugs were produced in Alpha-Gamma Cell 7 by dissolving irradiated (burnup) fuel in an acid solution, which was then diluted several times and mixed with cement and water and allowed to solidify in Styrofoam cups. The slugs will contain only limited amounts of dissolved fuel because of the dilution. The Styrofoam cups will be segregated from the slugs prior to final packaging. The waste matrix will also include Floor Dry and Radsorb added during repackaging to absorb any water from condensation or dewatering

### **Waste Stream Description**

Laundry sludge consists of a particulate sludge (dirt, debris, and lint) generated when the laundry system still box requires cleaning. The box is heated to boil off the water contained in the particulate material. The resulting sludge is raked into plastic bags containing Radsorb (10%-20% by weight) to absorb any water from condensation or dewatering.

### **Waste Stream Description**

Laundry Sock Filters and Lint are generated during the operation of the BCLDP TRU waste laundry system in the JN-1 Pump Room. This stream includes Rosedale polypropylene high-efficiency liquid filter bags and cotton lint from laundered mop heads and rags. No RCRA waste was processed through the laundry

### **Waste Stream Description**

Pressure Wash Filters used in the pressure wash water recovery system for filtering wash water transferred for evaporation. Three types of filter/cartridges were used. Cotton media filters consisting of cotton yarn and cotton media wound around a polypropylene core. Resin media type cartridges composed of glass and cellulose fibers combined with melamine resin, and a polypropylene sock filter consisting of polypropylene material supported by a carbon steel ring. Small quantities of sludge collected in the filter housings and settling tank bottoms are included in this waste stream. The waste matrix also includes Radsorb added to each liner.

Packaging Material, Lead

Packaging Material, Steel Plug

### **Waste Stream Description**

Sabotage Pieces consist of materials generated during repackaging of waste generated during research and development activities conducted on sabotage testing of model casks using simulated vitrified high-level waste. This waste stream consists primarily of iron-based metals.

### **Waste Stream Description**

Hydraulic Room Sludge and Debris waste consists of rubble, sludge, and absorbent materials as well as the plastic bags that the waste is in. The hydraulic sludge was absorbed using a greater than 50% No Char and Radsorb polymers. Then the hydraulic sludge was packed in plastic bags with additional No Char, Radsob, and Floor Dry. Prior to packaging, 10 pounds of absorbent (50:50 Floor Dry and Radsorb) was added to the liner to absorb and water from condensation or dewatering

### **Waste Stream Description**

Specimen processing fines, material, and debris.

### **Management Comments**

Bettis is not a long-term storage facility. TRU will be shipped off-site as directed by DOE-HDQ.

Original data showed 3 SWBs. Int. volume and # stored changed to more accurately reflect the waste volume of 2 m3 as follows: 2 m3 / .200 m3 / drum = 9.615 drums, rounded to 10 drums. Tb 3/27/03.

#### **Waste Stream Description**

Piping, pumps, tanks, and other metal items, and debris.

### **Management Comments**

Waste volumes revised to reflect latest estimates. This waste contains no classified material. Radionuclide data generated date is 10/2002. There are no pyrochemical salts, PCB's or other materials of particular concern. Bettis is not a long term stroage facility. TRU will be shipped off-site as directed by DOE-HDQ.

### **Waste Stream Description**

Generated after DOE fuel decladding operations and the clean-up of facilities. Wastes inlude soft trash (paper, plastic, rubber), vermiculite, solidified oil. Radiological contamination includes TRU (Pu-239/241/238/242,Am-241). The waste was packaged to the 1987 Idaho WIPP criteria in 4 55-gal drums. Waste stream is no longer generated.

### **Management Comments**

This W.S. was packaged to Idaho WIPP 1987 criteria. Options for shipping the waste to a suitable site are being considered by DOE.

### **Waste Stream Description**

Generated after DOE fuel decladding operations and the clean-up of facilities. Waste consists of a single 85-lb lead brick with surface transuranic contamination with other lead shielding and other waste (metals, filter, vermiculite and trash). Radiological contamination includes fission (Cs-137, Sr-90) and TRU (Pu-238/242/239/241, Am-241). The waste was packaged to the 1987 Idaho WIPP criteria in a single 55-gal drum. Waste stream is no longer generated.

#### **Management Comments**

This W.S. was packaged to Idaho WIPP 1987 criteria. ETEC has no longer the capability (hot cell of glove box) to package TRU contaminated materials.

#### **Waste Stream Description**

This waste stream, generated at Argonne National Laboratory-East, contains alpha gamma hot cell waste. Noncombustible and combustible waste are segregated. Combustible wastes include paper, plastic and PVC containers, rubber O-rings and gloves, rags, and Q-tips. Noncombustible wastes include lab equipment, tools, fixtures, glassware, pipe, tubing, fitting, fasteners, firebrick, ferrous and nonferrous metal scraps and parts, and small electric motors. Sodium in the waste is reacted with ethyl alcohol, mixed with pelletized clay, and dried. Nitrates and oxidizing agents are neutralized or reduced, mixed with pelletized clay, and dried to ferrous or ferric salts.

Packaging Material, Steel Plug

0.00

The average organic content is 80 kg/m3. The combustible content of some containers exceeds 25 volume percent, including packaging. Fines are within WIPP-WAC limits. No sludges or free liquids should be present. No explosive or pyrophoric materials should be in this waste. Surface contamination and nuclear criticality meet WIPP-WAC limits. Thermal power does not exceed 10 watts per package. Surface dose rates average 5.3 R/hr and are limited to 30 R/hr. The waste is packaged in 30 gallon drums.

The waste material parameter data for cellulosic, plastic, and rubber (CPR) proveded in the original submittal was 16 kg/m3. The difference between this and the CPR data in the CRA-2004 is due to a re-calculation of the final form waste volume to account for payload containers.

### **Waste Stream Description**

Waste consists of soils (approximately 60%) and associated sludge type wastes to be generated through environmental restoration activities at the Idaho National Engineering Laboratory's Subsurface Disposal Area (Pit 9). The sludge waste originated at the Rocky Flats Plant from various treatment processes in building 774. Sludge wastes included in the waste stream correspond to the following ID numbers: IN-W216, First Stage Sludge; IN-W228, Second Stage Sludge; IN-W309, Organic Setups Oil Solids; IN-W157, Special Setups (Cement); IN-W315, Evaporator Salts; IN-W276, Graphite. Graphite waste generated at the Rocky Flats Plant for casting plutonium metal is also included in the overall waste stream. The originally disposed sludges, graphite and surrounding soils are packaged in a single waste stream through environmental restoration retrieval and repackaging activities.

### **Waste Stream Description**

Waste consists of combustible and noncombustible heterogeneous debris generated through environmental restoration activities at the INEEL Subsurface disposal area (Pit 9). The debris includes drum remnants of sludge waste packaging material that originated at the Rocky Flats Plant from various treatment processes in building 774. Original packaging material (if still present) are segregated during retrieval operations and combined with noncombustible and combustible debris streams that originated at the Rocky Flats Plant. The original noncombustible and combustible debris streams are similar to the following ID numbers: IN-W169, dry Paper and Rags; IN-W278, Low Specific Activity Metal, Glass Etc.; and IN-W296, Non special Source Metal. The materials are combined in a single waste stream through environmental restoration retrieval repackaging activities.

### **Waste Stream Description**

Pre-1970 buried waste retrieved for the Idaho Completion Project

### **Management Comments**

Waste material parameters were taken from IN-228.101 - solidified inorganic second stage sludge, with the addition of soil (50% by volume). The waste will be placed into 55-gallon drum lliners and filled with approximately .142 m3 (5 ft3) of waste. The liner will then be placed into plastic transfer bags that will go into the 55-gallon drum.

### **Waste Stream Description**

Pre-1970 buried waste retrieved for the Idaho Completion Project

### **Management Comments**

Waste material parameters are based on OASIS waste stream at RFETS - RF-MT0801 with soils (50% by volume), reported in IN-GEM-01, and standard packaging materials. The waste will be placed into 55-gallon drum liners and filled with approximately .142 m3 (5 ft3) of waste. The liner will then be placed into plastic transfer bags that will go into the 55-gallon drum.

### **Waste Stream Description**

Pre-1970 buried waste retrieved for the Idaho Completion Project

### **Management Comments**

The waste material parameters were taken from IN-GEM-01, a graphite-containing waste stream with soils (50% by volume) and standard packaging added. The waste will be placed in 55-gallon drum liners and filled with approximately .142 m3 (5 ft3) of waste. The liner will then be placed into plastic transfer bags that will go into the 55-gallon drum.

#### **Waste Stream Description**

This waste stream was generated at the Idaho Chemical Processing Plant at the INEEL, and may include both combustibles and noncombustibles. The waste includes a solidified sludge of acid-dissolved fuel, absorbed into diatomaceous earth. Other materials in the wastes include glass containers, plastics, metal scraps, lead shielding, and lab equipment.

The waste is contained in two 30-gallon drums. At least one of the drums may be lead-lined. The sludge is contained in glass bottles and sealed inside metal cans. Other materials may include glass containers, plastics, metal, scraps, lead shielding, and miscellaneous laboratory equipment. The surface dose rate is limited to 30 R/hr.

Packaging Material, Lead

Packaging Material, Steel Plug

#### **Management Comments**

This waste stream was previously reported under IN-W257.

### **Waste Stream Description**

The waste materials include process equipment from the hot cells, various size containers (50 ml to 8 gal), various plastic and paper products, wooden handles, and various woven fabric materials.

Packaging Material, Lead

Packaging Material, Steel Plug

#### **Waste Stream Description**

This waste, generated at Rocky Flats Plant, consists of liquids absorbed on a cement mixture. The liquid wastes are not compatible with aqueous treatment processes and are handled separately due to their plutonium complexing nature.

The majority of complexing chemical wastes are generated by various operations at Building 771, Plutonium Recovery operations. All waste are processed by aqueous waste treatment, building 774. The complexing chemicals include some alcohols, organic acids, and versenes (trademark for a series of chelating agents based on EDTA). All liquids are analyzed or assayed prior to release to Building 774 for treatment. Only below-discard contaminated wastes are released for processing. Above discard contaminated wastes are processed by plutonium recovery operations.

The cement mixture used for absorbing complexing liquid wastes is composed of approximately 190 lb of Portland cement and 50 lb of pipe insulation cement, such as magnesia cement. The cements are placed in a prepared 55-gallon drum; the drum is them placed on a drum roller and rolled to ensure mixing of the cements. All liquid wastes are made basic prior to adding them to the cement mixture. Approximaterly 100 liters of liquid waste is then poured on the cement mixture and allowed to solidify. Approximately 10 to 15 lb of portland cement is then added on top of the cemented liquid waste before the o-ring bag is removed from the glovebox.

Since 1972, drums have been inspected for free liquids, proper packaging, and the use of proper content code. One to two quarts of oil-dri was placed on top of the outer, sealed polyethylene drum bag after inspection. In 1982, vermiculite replaced oil-dri to fill the remaining space between the outer, sealed polyethylene drum bag and the top of the rigid liner.

Some drums may be filled with the empty polyethylene bottles used to transport the liquid waste to Building 774. A small amount of portland cement is added to each bottle before placement in a drum.

### TRU WASTE BASELINE INVENTORY WASTE PROFILE

### **Management Comments**

Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

#### **Waste Stream Description**

This waste stream, generated at Rocky Flats Plant, includes Oil-Dri absorbent and waste from laundry and utility operations.

Organic content should be less than 14 lb/ft3. No sludges or free liquids should be present. The Oil-Dri should meet WIPP immobilization standards. No explosive or pyrophoric materials should be in this waste.

Packaging Material, Lead
Packaging Material, Steel Plug

The material is contained in 55-gallon drums. Inside the drums, the waste may be contained in PE bottles and/or metal paint cans and double-bagged in PE and PVC bags. Some waste may also be contained in PE residue process containers (RPCS). Drums were prepared and inspected according to pre and post-1972 procedures. Starting in 1982, vermiculite instead of Oil-Dri was used in the tops of the drums.

The waste matrix composition listed is for the incinerator waste. No information is available concerning the laundry and utility operation waste.

#### **Management Comments**

Total inventory figures as to number of containers and volume of waste, is considered to be fairly accurate. All waste is presently stored on indoor or earthen covered pads. Retrieval from the earthen covered pads will begin in the next 1 - 2 years.

#### **Waste Stream Description**

Organic and sludge immobilization system (OASIS) waste consists of cutting oil and organic solvents solidified with Envirostone emulsifier, gypsum concrete, and an accelerator.

Except for the solidifying agent, the waste is similar to Item Description Code (IDC) 003 waste, and has been assigned the same Waste matrix composition.

#### **Waste Stream Description**

This waste comes from Mound Laboratory. It consists of acid liquids, mainly nitric, absorbed onto a clay called Florco. The Florco is then placed in a drum bag in a drum lined with a 90-mil poly liner. Analytical assay values are available for each drum.

#### **Waste Stream Description**

This waste comes from Mound Laboratory. It consists of caustic waste and neutralized waste liquids, absorbed onto a clay called Florco. The Florco is then placed in a drum bag in a drum lined with a 90-mil poly liner. Analytical assay values are available for each drum.

#### **Waste Stream Description**

This waste is from Mound Labs. The waste consists of shower water, decontamination water, cooling water, and some acids and caustics which have been solidified in portland cement. The cement is poured into a drum lined with a 90-mil poly liner. Analytical assay values are available on a batch basis. Volume for this waste stream has increased significantly from the TWBIR Revision 2 volumes due to the additional Alpha Mixed Low-level waste (AMLLW).

#### **Waste Stream Description**

Waste consists of a wet sludge produced from treating aqueous process wastes, such as ion exchange column effluent, distillates, and caustic scrub solutions generated by Plutonium Recovery Operations (Building 771). Portland cement is added to the waste package for absorption of free liquids. Waste drums may periodically contain surgeons' gloves, gloves, etc.

Since the fall of 1979, first-stage sluge (IDC 001) and Second stage sludge (IDC 002) have been combined into Content Code 1 - Combined sludge.

Sludge is produced by treating aqueous wastes by the carrier precipitation process. Aqueous wastes are made basic, if necessary, with sodium hydroxide. Radioactive elements such as plutonium and americium are chemically precipitated from the liquid waste. Treatment chemicals include ferric sulfate, calcium chloride, magnesium sulfate, and flocculating agents. The treatment process produces a precipitate of the hydrated oxides of iron, magnesium, aluminum, silicon, etc., which also carries the hydrated oxides of plutonium and americium. The precipitate or slurry is filtered to produce a sludge containing 50 to 70 weight percent water.

Liquid wastes were analyzed for fissile content prior to release from Building 771 and 774, and were retained at Building 771 for further treatment if contaminated with above-discard amounts of plutonium.

#### **Waste Stream Description**

Building 374 solidified sludge consists of immobilized low-level mixed waste materials from decontamination-precipitation and neutralization processes in the Building 374 Liquid Waste Treatment Facility. The wastewater treatment operation includes neutralization, radioactive decontamination (precipitation), filtration, evaporation, spray drying, salt immobilization, and filtrate sludge immobilization. The sludge from the rotary drum vacuum filter has a dry appearance but is still very moist. The dried sludge was transferred from the dryer directly into a 55-gallon drum. The resulting waste consisted of dispersible fines and was assigned IDC 007.

#### **Waste Stream Description**

This waste steam, generated at Bettis Atomic Power Laboratory, consists of solidified grinding sludge and associated filters, rags, etc. The sludge can contain abraded grinding wheel material, which includes diamond dust, aluminum oxide, carborundum, and rubber. The waste is in either powder or cakes and contains not more than 10% of other waste items.

There are high levels of fines. In addition the drums may contain free liquids. The estimated organic content is less than 1 lb/ft3. No particle size data are provided, but it is assumed that WIPP-WAC limits for fines would be exceeded. No free liquids should be present. No explosive, pyrophoric, or corrosive material should be in the waste.

Both 17c and 6m 55-gallon drums were used for packaging the waste. Fissile content was determined by calculating the weight difference by chemical analysis or by an assay gauge.
