NUCLEAR WASTE MANAGEMENT PROCEDURE Sandia National Laboratories	**Validation Document Criteria**	**Form Number: NP 19-1-7** **Page 1 of 1**

1. **Software Name:** BRAGFLO
2. **Software Version:** 6.0
3. **Document Version:** 6.00 JL 4/5/07
4. **ERMS #:** 545018

Prior to sign-off of the VD, all items shall be appropriately addressed by the code sponsor so that "**Yes**" or "**N/A**" may be checked. Include this form as part of the VD.

5. **Is the following information included, where applicable?**

	Yes	N/A
(a) computer program and version tested	☒	☐
(b) computer hardware and operating system used	☒	☐
(c) test equipment and calibrations	☐	☒
(d) date of test	☒	☐
(e) tester or data recorder	☒	☐
(f) simulation models used,	☒	☐
(g) test problem input and output files	☒	☐
(h) results and acceptability	☒	☐
(I) action taken in connection with any deviations noted	☒	☐

6. **Test Result Validation**
The test results were compared to the following (check one or more, where applicable as based on code functionality):

	Yes	N/A
- hand calculations,	☒	☐
- manual inspection,	☒	☐
- calculations using comparable proven problems,	☒	☐
- empirical data & information from confirmed published data and correlations and/or technical literature,	☒	☐
- other validated software of similar purpose,	☒	☐
- other independent software of similar purpose.	☒	☐

7. **Test Documentation Acceptability** ☒ Yes
Do the tests meet the acceptance criteria identified in the approved VVP?

8. **Test Documentation Repeatability** ☒ Yes
Are the tests documented in sufficient detail such that they can be repeated?

9. **Computer File Documentation** ☒ Yes
Are the test case input and output files included in the Validation Document?

10. **Understandability of Documentation** ☒ Yes
Are the validation methods, test data, results, and conclusions documented in a form that can be understood by an independent, technically competent individual?

11.	Martin Nemer **Code Team/Sponsor** (*print*)	[signature] Signature	04/03/2007 Date
12.	Michael Riggins **Technical Reviewer** (*print*)	[signature] for Mike Riggins Signature	04/03/2007 Date
13.	Moo Y. Lee **Responsible Manager** (*print*)	[signature] Signature	4/3/2007 Date
14.	Jennifer Long **SCM Coordinator** (*print*)	Jennifer Long Signature	4/5/07 Date

Key for check boxes above:

Check **Yes** for each item reviewed and found acceptable
Check **N/A** for items not applicable

1.0 INTRODUCTION & SUMMARY

The purpose of this document is to summarize the results of the testing activities prescribed in the *WIPP PA Requirements Document & Verification and Validation Plan for BRAGFLO Version 6.0* (Nemer, 2007) and to provide evaluations based on those results. These tests showed that BRAGFLO 6.0 satisfies the requirements of the RD/VVP for each of the fourteen test cases and that BRAGFLO 6.0 should be approved for use in Waste Isolation Pilot Project (WIPP) Performance Assessment (PA) analyses. This Validation Document is in accordance with the Nuclear Waste Management Procedure NP 19-1 (Chavez, 2006).

Sandia National Laboratories used regression testing to determine whether BRAGFLO 6.0 satisfies the acceptance criteria of the RD/VVP for Test Cases #1-13. Test Case #14 is validated in this analysis by evaluating BRAGFLO results with respect to the acceptance criteria specified in the RD/VVP, since it is a new test case for the new requirements in BRAGFLO 6.0.

Regression analyses are accomplished in this validation work by comparing results from BRAGFLO 6.0 to the corresponding results from BRAGFLO 5.0. BRAGFLO 5.0 has been validated on the ES40, ES45 and ES47 with OpenVMS 8.2 (Nemer, 2006). The VMS Difference command is used to compare ASCII output files from BRAGLO 6.0 with the corresponding output files from BRAGFLO 5.0.

Many differences between the two sets of output involved dates and times, file and directory names, platform names, code version and date, and execution statistics; these differences are acceptable. The restatement of new input information in BRAGFLO 6.0 output constitutes another body of acceptable differences. Information that is now included in input files to BRAGFLO for the new models has been added to improve documentation of BRAGFLO analyses, as well as aid in the validation.

1.1 Software Identifier

Code Name: BRAGFLO
WIPP Prefix: BF2
Version: 6.0
Revised: February 12, 2007

The previous versions of BRAGFLO are Version 5.0, dated 3/19/2003, Version 4.10, dated 5/8/97, Version 4.01, dated 5/30/96, and Version 4.00, dated 2/11/96.

The previous versions of the Validation Document (VD) are Version 5.02 (Stein and Zelinski, 2004b), dated 8/27/2004, Version 1.20 (Schreiber, 1997b), dated 5/12/97, Version 1.10 (Morin, 1996), dated 6/05/96, and Version 1.00 (Schreiber, 1996), dated 3/06/96.

1.2 Points of Contact

Code Sponsor:	Martin Nemer, Sandia National Laboratories, (505) 234-0005
Code Consultant:	Daniel Clayton, Sandia National Laboratories, (505) 234-0013
Tester:	Jennifer Long, Sandia National Laboratories, (505) 234-0106

1.3 Description of BRAGFLO 6.0

BRAGFLO is a program used to study two-phase (brine and gas), three-dimensional isothermal flow in porous media. It is used for assessing the performance of the WIPP, particularly the flow behavior in the immediate vicinity of the repository. The physical model is described by material balance equations for brine and gas, Darcy's law, and two phase fluid properties. The numerical model includes a cell-centered finite difference discretization, Newton solution of the nonlinear constitutive equations, and linear equation solvers necessary for the Newton iteration. Various submodels specific to WIPP include a pressure-induced fracture treatment, creep closure of the repository, and gas generation resulting from corrosion and biodegradation of waste components.

The primary purpose for revision of BRAGFLO version 5.0 to 6.0 is to incorporate Fe and MgO chemistry into the model. The additional chemistry is added to improve the water balance equations. Furthermore, several other models are included into BRAGFLO 6.0 to allow more flexibility.

2.0 TESTING ENVIRONMENT

BRAGFLO, Version 6.0, is tested in the following environment:

Hardware Platform:	Compaq ES40, ES45 and ES47
Operating System:	OpenVMS Version 8.2
CMS Library:	LIBBF

3.0 TEST TOOLS

TABLE 3.1 Software Tools Used for Testing.

NAME OF TOOL	FUNCTIONALITY
Source Code Analyzer V4.9 (SCA)	Builds call tree for subroutines Identifies unreachable subroutines.
Performance Coverage Analyzer V4.9 (PCA)	Determines adequacy of test case coverage
HP Fortran V8.0-104655-48F7C	Compile source code and identify array overflow or underflow
POSTBRAG 4.00	Converts BRAGFLO output binary file into CAMDAT file, enabling further analyses using GROPECDB and BLOT
GROPECDB 2.12	Examines CAMDAT (.CDB) files
BLOT 1.37	Plotting software used to plot BRAGFLO results

4.0 STATIC TESTING

Only the BRAGFLO module is identified as not being referenced by SCA. BRAGFLO is the main program and is the point where the execution begins, so no other routine calls this module.

The results of the static analysis are in the file BF2_SCA_MOD_NOT_REF_QB0600.TXT stored in the LIBBF library and are shown in Figure 4.1.

FIGURE 4.1 Static Testing Results

```

5.0 COVERAGE TESTING

The coverage analysis executed all modules in the BRAGFLO source code that are used for the functionality being tested and all library modules directly referenced by BRAGFLO. The only modules flagged as not being covered are modules in BRAGFLO that needed for functionality not used for WIPP PA. The functionality not tested is documented in section 5.0 FUNCTIONALITY NOT TESTED in the RD/VVP for BRAGFLO (Nemer, 2007). The modules flagged as not being covered are the same modules as reported in the coverage analysis of BRAGFLO 4.10 (Schreiber 1997b). The seven new modules added for BRAGFLO 6.0 (BIOFES, BIOMGO, CORMGO, PORSOLID, RESETMID, SMOOTHPERM, STOREINT) are shown as covered in the testing.

The results of the coverage testing is in the file BF2_TEST_PCA_QB0600.TXT stored in the LIBBF library and are shown in Figure 5.1.

6.0 FUNCTIONAL TESTING

There are 24 functional requirements and 3 external interface requirements that BRAGFLO 6.0 must satisfy. These requirements are described in Section 2.0 REQUIREMENTS in the BRAGFLO RD/VVP (Nemer, 2007). Test Cases 1 – 13 are unchanged from the previous RD/VVP (Stein; Zelinski, 2004a), and are described in sections 9.0 through 9.13, which are used to show that BRAGFLO satisfies Requirements R.1 through R.19 and R.25 through R.27. Sections 6.1 through 6.13 of this document describe the corresponding results of these tests. Section 9.14 of the RD/VVP (Nemer, 2007) describes Test Case 14, which is new to this version of the RD/VVP. This test case specifically tests the new additions to requirements R.5, R.7, R.18, and the new requirements R.20-R.24, and results are presented in Section 6.14 of this document.

6.1 Test Case #1. Pressure Drawdown with Radial Grid.

6.1.1 Test Objective

The purpose of Test Case #1 is to verify that BRAGFLO can accurately calculate transient fluid pressures using a Cartesian representation of a radial grid by comparing BRAGFLO results with an analytical solution. This is a test of Functional Requirement R.15, for a single phase.

This is a very basic simulation of pressure drawdown in a radially symmetric reservoir as brine is injected into the center. The radially symmetric grid is represented by a one-dimensional Cartesian grid in which the Cartesian grid blocks preserve the volume of the corresponding radial grid blocks. The analytical solution to this problem is found in (Collins 1961):

$$p(r,t) = p_o + \frac{Q\mu}{4\pi kh}\left[-Ei\left(-\frac{\phi\mu\, c_b r^2}{4kt}\right) + Ei\left(-\frac{\phi\mu\, c_b r^2}{4k(t-t_s)}\right)\right] \qquad (6.1.1)$$

where

p = brine pressure [Pa],
p_o = initial brine pressure, 1.0×10^7 Pa,
Q = brine injection rate, -0.01 m^3/s,

μ = brine viscosity, 0.0018 Pa s,
k = permeability, 1.8×10^{-11} m^2,
h = thickness of formation, 1.0 m,
ϕ = porosity, 0.1 m^3 void/m^3 rock,
c_b = brine compressibility, 2.5 10^{-10} Pa^{-1},
r = radial distance from center [m],
t = time [s],
t_s = shut-in time, 5000 s,
Ei = exponential integral.

Plots of the analytical solution are shown in Figures 6.1.1 and 6.1.2; corresponding numerical values for the analytical solution are shown in Tables 6.1.1 and 6.1.2.

In addition, this test case tests the basic Functional Requirements R.1 to R.3, R.5 to R.7, R.11, and R.18, which describe the problem being tested. Functional Requirement R.16, the well models, is exercised, but is not examined explicitly in this test case. Functional Requirement R.15, flow calculations for two phases in a porous medium, is also implicitly tested.

FIGURE 6.1.1 Analytical Solution for Test Case #1: Pressure Drawdown at Shut-In Time, t = 5000 s

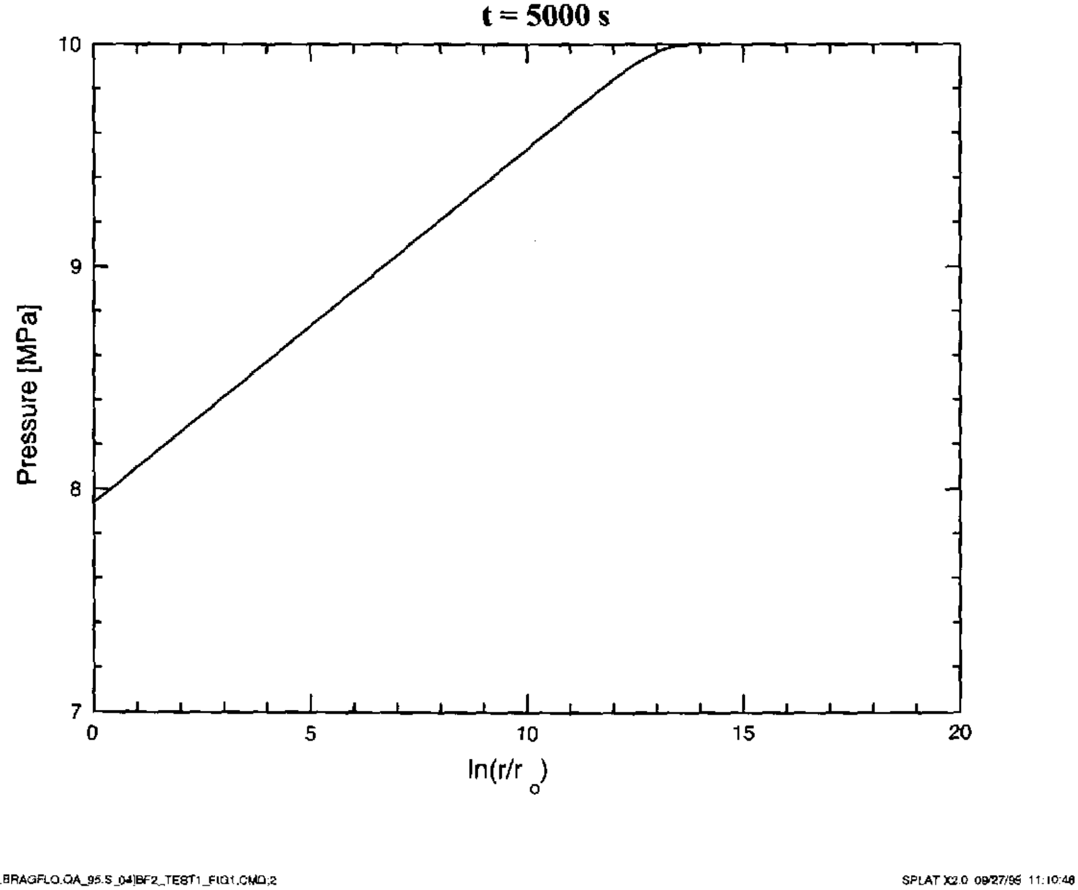

FIGURE 6.1.2 Analytical Solution for Test Case #1: Pressure Drawdown History at Distance from Well of r = 100.4 m

6.1.2 Test Procedure

Test Case #1 is run using the WIPP PA run control system. The scripts, script input files, and all other files related to validation testing of BRAGFLO 6.0 reside in QB0600 class of the CMS library, LIBBF. All test inputs are fetched at run time by the scripts, and test outputs/results and run logs are automatically stored by the scripts in the CMS library. The test case is run on each of the three platforms, ES40, ES45 and ES47. Excerpts from the BRAGFLO 6.0, Test Case #1, .LOG files, BF2_QB0600_ES40_TEST1_RUN.LOG, BF2_QB0600_ES45_TEST1_RUN.LOG and BF2_QB0600_ES47_TEST1_RUN.LOG are included in Appendix A.1.1. These indicate the files that are used or generated.

To validate BRAGFLO 6.0 on all three platforms, the following procedure is performed for Test Case #1.

1) Validation test results from BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 5.0 run on the ES47 with OpenVMS 8.2 (Nemer, 2006).
2) Validation test results from BRAGFLO 6.0 run on the ES40 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.
3) Validation test results from BRAGFLO 6.0 run on the ES45 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

The VMS DIFFERENCE command is used to compare the output file from BRAGFLO 6.0 to the corresponding output file as outlined above. Differences are recorded in ASCII files. Differences that involve dates and times, file and directory names, platform names, code version and date, and execution statistics are deemed to be acceptable. In addition, differences, involving the reporting of new input information for BRAGFLO 6.0 in the output files, are acceptable and desirable, because they improve documentation of analyses. Numerical differences, if any, are evaluated according the requirements of the BRAGFLO 6.0 RD/VVP (Nemer, 2007).

The results from the validation test of BRAGFLO 5.0 on the ES47 running OpenVMS 8.2 were determined valid by comparison to the output from the validation of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 (Nemer, 2006). The output of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 was determined to be valid by comparison to the output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 (Stein; Zelinski, 2004b). The output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 was determined valid by comparison to the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 (Fox; Trone, 2003). In turn, the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 was determined to be valid by comparison to the output of the validation of BRAGFLO 4.10, done on an Alpha 2100 running OpenVMS 6.1 (Hanson; Fox; Trone, 2003). In the validation for Test Case #1 for BRAGFLO 4.10, the acceptance criteria were comparisons with confirmed published data and technical literature and independent calculations, together with manual inspection of the output from the test case (Schreiber 1997a). The code BF2_TEST1_POST.FOR was run to extract results from the BRAGFLO ASCII output file, BF2_TEST1.OUT, and place the results into two data files, BF2_TEST1_RAD.DAT and BF2_TEST1_TIME.DAT, which were input to the plotting software, SPLAT. The resulting plots superimposed BRAGFLO results and the independent results. Numerical comparisons were also performed.

6.1.3 Input Files

Two types of input files are required to run BRAGFLO 6.0. The first input file, BF2_QB0600_TEST1.INP, is an ASCII control file generated by the PREBRAG software module and is shown in Appendix A.1.2. This file is generated by modifying the input file, BF2_TEST1_QA0500.INP, which was used in the validation of BRAGFLO 5.0, for the new input information for BRAGFLO 6.0. The VMS DIFFERENCE command is used to compare these two files and the differences are recorded in the ASCII file, BF2_QB0600_ES47_TEST1_INP.DIF (Figure 6.1.3). As seen in Figure 6.1.3, the differences between the input files consist of four sections that correspond to the new input information for BRAGFLO 6.0. The first section contains the input of the initial MgO concentration (with the values all set to zero), while the next section shows the input for the material change reset model (with the model disabled by the 0 in the input). The third section contains the input parameters for permeability models 11 and 12 (which are not used in this testcase), as well as for the smooth permeability model (with the model disabled by the 0 in the input). The last section contains the input parameters for the chemistry models, which are all disabled for this testcase.

```

The second input file, BF2_CLOSURE.DAT, contains the closure surface data required by BRAGFLO to define the creep closure surface within the repository. The same input file is used for all 14 test cases. It is too wide to fit the format of a written report, but it is stored in class QB0600 of the CMS library. BF2_CLOSURE.DAT is an ASCII input file that is read by BRAGFLO if creep closure is to be simulated. If creep closure is not to be simulated a dummy file must be included even though this dummy file will not be read. The user is responsible for the creation of a file with porosity surface information. It is not generated by PREBRAG, but a .CSD file is generated by the SANTOS software module, which can be used as the BRAGFLO 6.0 input file.

6.1.4 Test Results

Regression testing is used for Test Case #1 to show that the acceptance criteria for BRAGFLO 6.0 have been satisfied. The ASCII output file, BF2_QB0600_ES47_TEST1.OUT, from Test Case #1 of BRAGFLO 6.0 run on the ES47 is compared to the output file, BF2_VMS82_V500_ES47_TEST1.OUT (Nemer, 2006), using the VMS DIFFERENCE command. The results are stored in BF2_QB0600_ES47_TEST1_OUT.DIF, which is shown in Appendix A.1.3, with differences due to reporting of new input information indicated in bold italics. A summary of differences is listed in Figure 6.1.4.

FIGURE 6.1.4 Summary of Difference Statistics for Test Case #1

```

- Difference in dates and times, file and directory names, code version and date, and execution statistics: 92 sections;
- Differences due to new input: 6 sections.

The ASCII output files, BF2_QB0600_ES40_TEST1.OUT and BF2_QB0600_ES45_TEST1.OUT, from Test Case #1 of BRAGFLO 6.0 run on the ES40 and ES45, respectively, are compared to the output file, BF2_QB0600_ES47_TEST1.OUT, using the VMS DIFFERENCE command, with the results stored in BF2_QB0600_ES40_TEST1_OUT.DIF and BF2_QB0600_ES45_TEST1_OUT.DIF (Appendix A.1.4), respectively. Examinations of these files show that there are no differences other than run dates and times, file and directory names, platform names, and execution statistics.

There are no unacceptable differences in values of output variables for Test Case #1 between BRAGFLO 6.0 and BRAGFLO 5.0 running on the OpenVMS 8.2 operating system. Visual inspection of the ASCII output files confirmed that the input that describes the test case is read correctly. Based on the comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified for Test Case #1 in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.

6.2 Test Case #2. Horizontal One-Dimensional Infiltration

6.2.1 Test Objective

The purpose of this test is to verify that BRAGFLO can accurately track a propagating wetting profile in a horizontal, partially saturated, one-dimensional system. In this problem, a semi-infinite horizontal tube of porous material is partially saturated with water. At time zero, the left end of the tube is wetted, raising the water content to full saturation; the saturation is held constant thereafter at fully saturated condition. The flow of water along the tube is to be calculated. This tests the fundamental Functional Requirement R.15, the calculation of multiphase flow in a porous medium.

Test Case #2 has a semi-analytical solution originally solved by Philip (1955) and described by (Ross et al. 1982), and are listed in Tables 6.2.1 and 6.2.2. The solution was featured as Sample Problem No. 2 in the TOUGH User's Guide (Pruess 1987). It has been further described by (Updegraff 1989) and by (Moridis and Pruess 1992). The semi-analytical solution is shown in Figure 6.2.1, in which water saturation profiles along the tube are shown at different times.

In addition, this test case tests the basic Functional Requirements R.1 to R.3, R.5 to R.8, R.15 and R.18 which describe the problem being tested, and R.11 and R.12, the equations of state for fluids.

This test case uses linear relative permeability and capillary models:

$$k_{rw} = \begin{cases} 0, & S_w \le S_{wr} \\ \dfrac{S_w - S_{wr}}{1 - S_{wr} - S_{nwr}}, & S_{wr} < S_w < 1 - S_{nwr} \\ 1, & S_w \ge 1 - S_{nwr} \end{cases} \tag{6.2.1}$$

$$k_{rnw} = 1 - k_{rw} \tag{6.2.2}$$

$$P_c = \begin{cases} P_{c,\max}, & S_w \le S_{wr} \\ \left(P_{ct} - P_{c,\max}\right)\dfrac{S_w - S_{wr}}{1 - S_{wr} - S_{nwr}} + P_{c,\max}, & S_{wr} < S_w < 1 - S_{nwr} \\ P_{ct}, & S_w \ge 1 - S_{nwr} \end{cases} \tag{6.2.3}$$

where

k_{rw} = brine relative permeability,
k_{rnw} = gas relative permeability,
S_w = wetting phase (brine) saturation,
S_{wr} = brine residual saturation = 0.3333333,
S_{nwr} = nonwetting phase (gas) residual saturation = 0.0,

P_c = capillary pressure [Pa],
$P_{c,max}$ = maximum capillary pressure [Pa] = 9807.0 Pa
P_{ct} = threshold capillary pressure [Pa] = 0.0 Pa.

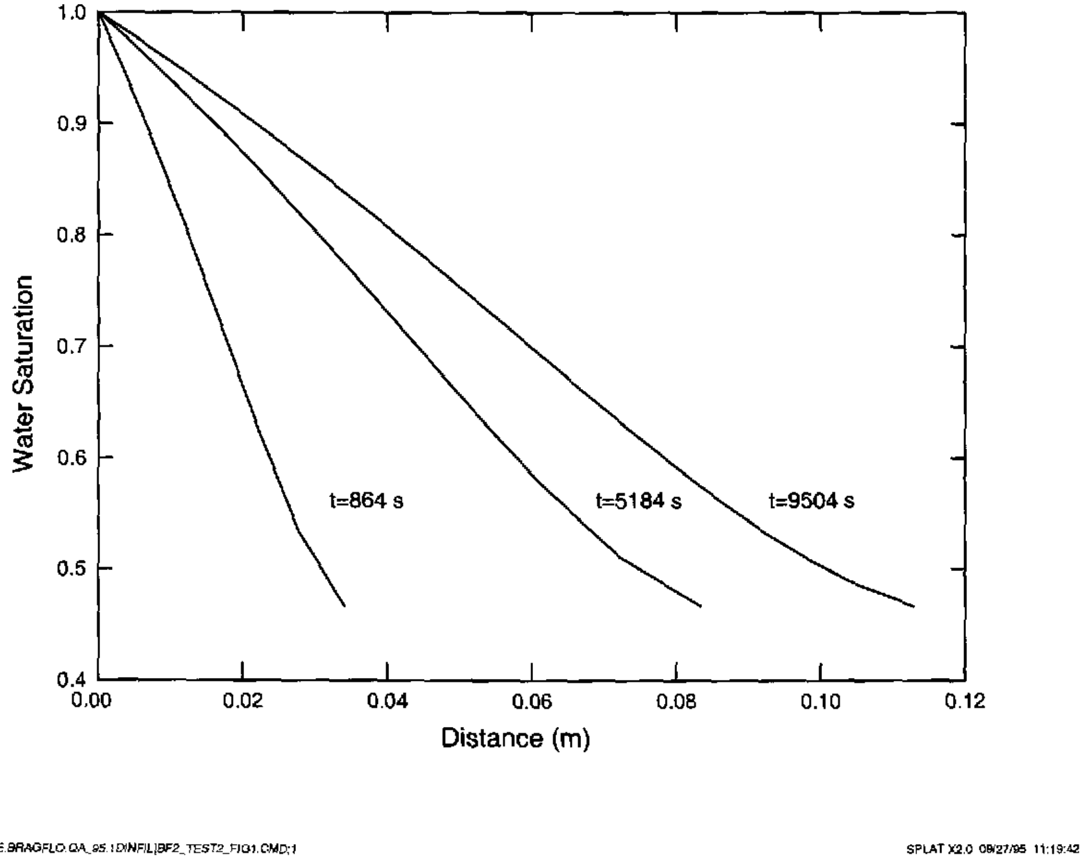
FIGURE 6.2.1 Analytical Solution for Test Case #2: Saturation Profiles along Tube at various Times for One-Dimensional Infiltration Problem



6.2.2 Test Procedure

Test Case #2 is run using the WIPP PA run control system. The scripts, script input files, and all other files related to validation testing of BRAGFLO 6.0 reside in QB0600 class of the CMS library, LIBBF. All test inputs are fetched at run time by the scripts, and test outputs/results and run logs are automatically stored by the scripts in the CMS library. The test case is run on each of the three platforms, ES40, ES45 and ES47. Excerpts from the BRAGFLO 6.0, Test Case #2, .LOG files, BF2_QB0600_ES40_TEST2_RUN.LOG, BF2_QB0600_ES45_TEST2_RUN.LOG and BF2_QB0600_ES47_TEST2_RUN.LOG are included in Appendix A.2.1. These indicate the files that are used or generated.

To validate BRAGFLO 6.0 on all three platforms, the following procedure is performed for Test Case #2.

1) Validation test results from BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 5.0 run on the ES47 with OpenVMS 8.2 (Nemer, 2006).
2) Validation test results from BRAGFLO 6.0 run on the ES40 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

3) Validation test results from BRAGFLO 6.0 run on the ES45 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

The VMS DIFFERENCE command is used to compare the output file from BRAGFLO 6.0 to the corresponding output file as outlined above. Differences are recorded in ASCII files. Differences that involve dates and times, file and directory names, platform names, code version and date, and execution statistics are deemed to be acceptable. In addition, differences, involving the reporting of new input information for BRAGFLO 6.0 in the output files, are acceptable and desirable, because they improve documentation of analyses. Numerical differences, if any, are evaluated according the requirements of the BRAGFLO 6.0 RD/VVP (Nemer, 2007).

The results from the validation test of BRAGFLO 5.0 on the ES47 running OpenVMS 8.2 were determined valid by comparison to the output from the validation of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 (Nemer, 2006). The output of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 was determined to be valid by comparison to the output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 (Stein; Zelinski, 2004b). The output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 was determined valid by comparison to the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 (Fox; Trone, 2003). In turn, the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 was determined to be valid by comparison to the output of the validation of BRAGFLO 4.10, done on an Alpha 2100 running OpenVMS 6.1 (Hanson; Fox; Trone, 2003). In the validation for Test Case #2 for BRAGFLO 4.10, the acceptance criteria were comparisons with confirmed published data and technical literature and independent calculations, together with manual inspection of the output from the test case (Schreiber 1997a). The code BF2_TEST2_BSAT.FOR was run to extract results from the BRAGFLO ASCII output file, BF2_TEST2.OUT, and place the results into three data files, BF2_TEST2_ASAT01.DAT, BF2_TEST2_ASAT06.DAT, and BF2_TEST2_ASAT11.DAT, which were input to the plotting software, SPLAT. The resulting plots superimposed BRAGFLO results and the independent results. Numerical comparisons were also performed.

6.2.3 Input Files

Two types of input files are required to run BRAGFLO 6.0. The first input file, BF2_QB0600_TEST2.INP, is an ASCII control file generated by the PREBRAG software module and is shown in Appendix A.2.2. This file is generated by modifying the input file, BF2_TEST2_QA0500.INP, which was used in the validation of BRAGFLO 5.0, for the new input information for BRAGFLO 6.0. The VMS DIFFERENCE command is used to compare these two files and the differences are recorded in the ASCII file, BF2_QB0600_ES47_TEST2_INP.DIF (Figure 6.2.2). As seen in Figure 6.2.2, the differences between the input files consist of four sections that correspond to the new input information for BRAGFLO 6.0. The first section contains the input of the initial MgO concentration (with the values all set to zero), while the next section shows the input for the material change reset model (with the model disabled by the 0 in the input). The third section contains the input parameters for permeability models 11 and 12 (which are not used in this testcase), as well as for the smooth permeability model (with the model disabled by the 0 in the input). The last section contains the input parameters for the chemistry models, which are all disabled for this testcase.

```

The second input file, BF2_CLOSURE.DAT, contains the closure surface data required by BRAGFLO to define the creep closure surface within the repository. The same input file is used for all 14 test cases. It is too wide to fit the format of a written report, but it is stored in class QB0600 of the CMS library. BF2_CLOSURE.DAT is an ASCII input file that is read by BRAGFLO if creep closure is to be simulated. If creep closure is not to be simulated a dummy file must be included even though this dummy file will not be read. The user is responsible for the creation of a file with porosity surface information. It is not generated by PREBRAG, but a .CSD file is generated by the SANTOS software module, which can be used as the BRAGFLO 6.0 input file.

6.2.4 Test Results

Regression testing is used for Test Case #2 to show that the acceptance criteria for BRAGFLO 6.0 have been satisfied. The ASCII output file, BF2_QB0600_ES47_TEST2.OUT, from Test Case #2 of BRAGFLO 6.0 run on the ES47 is compared to the output file, BF2_VMS82_V500_ES47_TEST2.OUT (Nemer, 2006), using the VMS DIFFERENCE command. The results are stored in BF2_QB0600_ES47_TEST2_OUT.DIF, which is shown in Appendix A.2.3, with differences due to reporting of new input information indicated in bold italics. A summary of differences is listed in Figure 6.2.3.

- Difference in dates and times, file and directory names, code version and date, and execution statistics: 10 sections
- Differences due to new input: 6 sections.

The ASCII output files, BF2_QB0600_ES40_TEST2.OUT and BF2_QB0600_ES45_TEST2.OUT, from Test Case #2 of BRAGFLO 6.0 run on the ES40 and ES45, respectively, are compared to the output file, BF2_QB0600_ES47_TEST2.OUT, using the

VMS DIFFERENCE command, with the results stored in BF2_QB0600_ES40_TEST2_OUT.DIF and BF2_QB0600_ES45_TEST2_OUT.DIF (Appendix A.2.4), respectively. Examinations of these files show that there are no differences other than run dates and times, file and directory names, platform names, and execution statistics.

There are no unacceptable differences in values of output variables for Test Case #2 between BRAGFLO 6.0 and BRAGFLO 5.0 running on the OpenVMS 8.2 operating system. Visual inspection of the ASCII output files confirmed that the input that describes the test case is read correctly. Based on the comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified for Test Case #2 in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.

6.3 Test Case #3. Horizontal One-Dimensional Infiltration, With Dirichlet Boundary Condition.

6.3.1 Test Objective

This test is identical to Test Case #2 except that the Dirichlet boundary condition feature in BRAGFLO, Functional Requirement R.4, is applied. Only Functional Requirements R.4 and R18 are tested, since other applicable requirements are tested in Test Case #2. In Test Case #2, the water saturation at the left boundary was not actually fixed, as the problem statement requires. Instead, the grid cell at the left boundary was made very large so that the pressure and water saturation in that cell do not change appreciably over the course of the run. This is an approximation that is satisfactory as long as the input is sized properly, both in the physical size of the mesh and in the simulated duration of the run. A more exact and rigorous approach is to apply a Dirichlet condition at the boundary. Using this feature in BRAGFLO, the pressure and water saturation at the left boundary can be fixed at exactly the value specified. The purpose of this test is to verify that BRAGFLO can hold the pressure and water saturation fixed, at values specified in the input, at specified grid cells, while continuing to track accurately a propagating wetting profile in a horizontal, partially saturated, one-dimensional system. In addition, completion of this test requires that output files be written which will confirm R.18.

6.3.2 Test Procedure

Test Case #3 is run using the WIPP PA run control system. The scripts, script input files, and all other files related to validation testing of BRAGFLO 6.0 reside in QB0600 class of the CMS library, LIBBF. All test inputs are fetched at run time by the scripts, and test outputs/results and run logs are automatically stored by the scripts in the CMS library. The test case is run on each of the three platforms, ES40, ES45 and ES47. Excerpts from the BRAGFLO 6.0, Test Case #3, .LOG files, BF2_QB0600_ES40_TEST3_RUN.LOG, BF2_QB0600_ES45_TEST3_RUN.LOG and BF2_QB0600_ES47_TEST3_RUN.LOG are included in Appendix A.3.1. These indicate the files that are used or generated.

To validate BRAGFLO 6.0 on all three platforms, the following procedure is performed for Test Case #3.

1) Validation test results from BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 5.0 run on the ES47 with OpenVMS 8.2 (Nemer, 2006).
2) Validation test results from BRAGFLO 6.0 run on the ES40 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.
3) Validation test results from BRAGFLO 6.0 run on the ES45 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

The VMS DIFFERENCE command is used to compare the output file from BRAGFLO 6.0 to the corresponding output file as outlined above. Differences are recorded in ASCII files. Differences that involve dates and times, file and directory names, platform names, code version and date, and execution statistics are deemed to be acceptable. In addition, differences, involving the reporting of new input information for BRAGFLO 6.0 in the output files, are acceptable and desirable, because they improve documentation of analyses. Numerical differences, if any, are evaluated according the requirements of the BRAGFLO 6.0 RD/VVP (Nemer, 2007).

The results from the validation test of BRAGFLO 5.0 on the ES47 running OpenVMS 8.2 were determined valid by comparison to the output from the validation of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 (Nemer, 2006). The output of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 was determined to be valid by comparison to the output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 (Stein; Zelinski, 2004b). The output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 was determined valid by comparison to the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 (Fox; Trone, 2003). In turn, the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 was determined to be valid by comparison to the output of the validation of BRAGFLO 4.10, done on an Alpha 2100 running OpenVMS 6.1 (Hanson; Fox; Trone, 2003). In the validation for Test Case #3 for BRAGFLO 4.10, the acceptance criteria were comparisons with confirmed published data and technical literature and independent calculations, together with manual inspection of the output from the test case (Schreiber 1997a). The code BF2_TEST3_BSAT.FOR was run to extract results from the BRAGFLO ASCII output file, BF2_TEST3.OUT, and place the results into three data files, BF2_TEST3_ASAT01.DAT, BF2_TEST3_ASAT06.DAT, and BF2_TEST3_ASAT11.DAT, which were input to the plotting software, SPLAT. The resulting plots superimposed BRAGFLO results and the independent results. Numerical comparisons were also performed.

6.3.3 Input Files

Two types of input files are required to run BRAGFLO 6.0. The first input file, BF2_QB0600_TEST3.INP, is an ASCII control file generated by the PREBRAG software module and is shown in Appendix A.3.2. This file is generated by modifying the input file, BF2_TEST3_QA0500.INP, which was used in the validation of BRAGFLO 5.0, for the new input information for BRAGFLO 6.0. The VMS DIFFERENCE command is used to compare these two files and the differences are recorded in the ASCII file, BF2_QB0600_ES47_TEST3_INP.DIF (Figure 6.3.1). As seen in Figure 6.3.1, the differences between the input files consist of four sections that correspond to the new input information for BRAGFLO 6.0. The first section contains the input of the initial MgO concentration (with the values all set to zero), while the next section shows the input for the material change reset model (with the model disabled by the 0 in the input). The third section contains the input parameters for permeability models 11 and 12 (which are not used in this testcase), as well as for the smooth permeability model (with the model disabled by the 0 in the input). The last section contains the input parameters for the chemistry models, which are all disabled for this testcase.

The second input file, BF2_CLOSURE.DAT, contains the closure surface data required by BRAGFLO to define the creep closure surface within the repository. The same input file is used for all 14 test cases. It is too wide to fit the format of a written report, but it is stored in class QB0600 of the CMS library. BF2_CLOSURE.DAT is an ASCII input file that is read by BRAGFLO if creep closure is to be simulated. If creep closure is not to be simulated a dummy file must be included even though this dummy file will not be read. The user is responsible for the creation of a file with porosity surface information. It is not generated by PREBRAG, but a .CSD file is generated by the SANTOS software module, which can be used as the BRAGFLO 6.0 input file.

6.3.4 Test Results

Regression testing is used for Test Case #3 to show that the acceptance criteria for BRAGFLO 6.0 have been satisfied. The ASCII output file, BF2_QB0600_ES47_TEST3.OUT, from Test Case #3 of BRAGFLO 6.0 run on the ES47 is compared to the output file, BF2_VMS82_V500_ES47_TEST3.OUT (Nemer, 2006), using the VMS DIFFERENCE command. The results are stored in BF2_QB0600_ES47_TEST3_OUT.DIF, which is shown in Appendix A.3.3, with differences due to reporting of new input information indicated in bold italics. A summary of differences is listed in Figure 6.3.2.

FIGURE 6.3.2 Summary of Difference Statistics for Test Case #3

- Difference in dates and times, file and directory names, code version and date, and execution statistics: 12 sections;
- Differences due to new input: 6 sections.

The ASCII output files, BF2_QB0600_ES40_TEST3.OUT and BF2_QB0600_ES45_TEST3.OUT, from Test Case #3 of BRAGFLO 6.0 run on the ES40 and ES45, respectively, are compared to the output file, BF2_QB0600_ES47_TEST3.OUT, using the VMS DIFFERENCE command, with the results stored in BF2_QB0600_ES40_TEST3_OUT.DIF and BF2_QB0600_ES45_TEST3_OUT.DIF (Appendix

A.3.4), respectively. Examinations of these files show that there are no differences other than run dates and times, file and directory names, platform names, and execution statistics.

There are no unacceptable differences in values of output variables for Test Case #3 between BRAGFLO 6.0 and BRAGFLO 5.0 running on the OpenVMS 8.2 operating system. Visual inspection of the ASCII output files confirmed that the input that describes the test case is read correctly. Based on the comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified for Test Case #3 in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.

6.4 Test Case #4. Two-Dimensional Infiltration.

6.4.1 Test Objective

The purpose of this test is to verify that BRAGFLO can accurately track a propagating wetting profile in a partially saturated, vertical, two-dimensional system. Results are compared both with TOUGH and with experimental measurements made by Vauclin et al. (1979).

A vertical slab of soil has dimensions 3 m by 2 m. At initial time, the water table is located 0.65 m from the bottom. In this saturated region, the water saturation is 1.0, and the water is in gravity equilibrium. Above the water table, the soil is unsaturated and in gravity/capillary equilibrium. The lower boundary and left boundary (line of symmetry) are impervious to flow. The right boundary is a mixed type, with the surface below the water table a constant pressure and constant water saturation of 1. Above the water table, the right boundary is a seepage surface in which the water flux is zero when the surface is unsaturated and maintains a pressure equal to the hydraulic head when the surface is saturated. The seepage face across the top surface is simulated by a no-flow boundary, as discussed by Moridis and Pruess (1992). Beginning at initial time, infiltration is modeled by water injection along the first 0.5 m of the top surface at a fixed rate of 4.111 × 10-5 m/s. Figure 6.4.1 shows water content as a function of depth into the soil slab at various times after the start of recharge, and compares TOUGH simulation results with experimental results at a horizontal distance of 0.19 m from the line of symmetry. In Figure 6.4.2, TOUGH and experimental results are compared at a distance of 1.39 m from the line of symmetry.

Simulating the advance of the saturation front during the recharge of the system using BRAGFLO is a test of Functional Requirement R.15. Use of a well model to inject water is a test of Functional Requirement R.16.

The BRAGFLO and TOUGH solutions use a relative permeability and capillary pressure model specific to this test case based on experimental measurements and analyses done by (Vauclin et al. 1979). Their correlations for unsaturated hydraulic conductivity and moisture content as functions of capillary head have been converted to correlations for relative permeability and capillary pressure as follows:

$$S_e = \frac{1-S_w}{S_w} \tag{6.4.1}$$

$$k_{rw} = \frac{1}{1+28.768353 S_e^{1.7241379}} \tag{6.4.2}$$

$$k_{rnw} = 1 - k_{rw} \tag{6.4.3}$$

$$P_c = 3783.0145 S_e^{(1/2.9)} \tag{6.4.4}$$

where

S_w = wetting phase (brine) saturation,

S_e = effective brine saturation,
k_{rw} = brine relative permeability,
k_{rnw} = gas relative permeability,
P_c = capillary pressure [Pa],

Although these models are not used in the compliance calculations, their use in this test case requires that they be tested to validate Functional Requirement R.8.

In addition, this test case tests the basic Functional Requirements R.1 to R.3, R.5 to R.7, and R.18, which describe the problem being tested, and R.11 to R.12, the equations of state for the fluids.

6.4.2 Test Procedure

Test Case #4 is run using the WIPP PA run control system. The scripts, script input files, and all other files related to validation testing of BRAGFLO 6.0 reside in QB0600 class of the CMS library, LIBBF. All test inputs are fetched at run time by the scripts, and test outputs/results and run logs are automatically stored by the scripts in the CMS library. The test case is run on each of the three platforms, ES40, ES45 and ES47. Excerpts from the BRAGFLO 6.0, Test Case #4, .LOG files, BF2_QB0600_ES40_TEST4_RUN.LOG, BF2_QB0600_ES45_TEST4_RUN.LOG and BF2_QB0600_ES47_TEST4_RUN.LOG are included in Appendix A.4.1. These indicate the files that are used or generated.

To validate BRAGFLO 6.0 on all three platforms, the following procedure is performed for Test Case #4.

1) Validation test results from BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 5.0 run on the ES47 with OpenVMS 8.2 (Nemer, 2006).
2) Validation test results from BRAGFLO 6.0 run on the ES40 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.
3) Validation test results from BRAGFLO 6.0 run on the ES45 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

The VMS DIFFERENCE command is used to compare the output file from BRAGFLO 6.0 to the corresponding output file as outlined above. Differences are recorded in ASCII files. Differences that involve dates and times, file and directory names, platform names, code version and date, and execution statistics are deemed to be acceptable. In addition, differences, involving the reporting of new input information for BRAGFLO 6.0 in the output files, are acceptable and desirable, because they improve documentation of analyses. Numerical differences, if any, are evaluated according the requirements of the BRAGFLO 6.0 RD/VVP (Nemer, 2007).

The results from the validation test of BRAGFLO 5.0 on the ES47 running OpenVMS 8.2 were determined valid by comparison to the output from the validation of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 (Nemer, 2006). The output of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 was determined to be valid by comparison to the output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 (Stein; Zelinski, 2004b). The output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 was determined valid by comparison to the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 (Fox; Trone, 2003). In turn, the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 was determined to be valid by comparison to the output of the validation of BRAGFLO 4.10, done on an Alpha 2100 running OpenVMS 6.1 (Hanson; Fox; Trone, 2003). In the validation for Test Case #4 for BRAGFLO 4.10, the acceptance criteria were comparisons with confirmed published data and technical literature and independent calculations, together with manual inspection of the output from the test case (Schreiber 1997a). The code BF2_TEST4_BSAT.FOR was run to extract results from the BRAGFLO ASCII output file, BF2_TEST4.OUT, and place the results into a data file, which was input to the plotting software, SPLAT. The resulting plots superimposed BRAGFLO results and the independent results. Numerical comparisons were also performed.

6.4.3 Input Files

Two types of input files are required to run BRAGFLO 6.0. The first input file, BF2_QB0600_TEST4.INP, is an ASCII control file generated by the PREBRAG software module and is shown in Appendix A.4.2. This file is generated by modifying the input file, BF2_TEST4_QA0500.INP, which was used in the validation of BRAGFLO 5.0, for the new input information for BRAGFLO 6.0. The VMS DIFFERENCE command is used to compare these two files and the differences are recorded in the ASCII file, BF2_QB0600_ES47_TEST4_INP.DIF (Figure 6.4.3). As seen in Figure 6.4.3, the differences between the input files consist of four sections that correspond to the new input information for BRAGFLO 6.0. The first section contains the input of the initial MgO concentration (with the values all set to zero), while the next section shows the input for the material change reset model (with the model disabled by the 0 in the input). The third section contains the input parameters for permeability models 11 and 12 (which are not used in this testcase), as well as for the smooth permeability model (with the model disabled by the 0 in the input). The last section contains the input parameters for the chemistry models, which are all disabled for this testcase.

The second input file, BF2_CLOSURE.DAT, contains the closure surface data required by BRAGFLO to define the creep closure surface within the repository. The same input file is used for all 14 test cases. It is too wide to fit the format of a written report, but it is stored in class QB0600 of the CMS library. BF2_CLOSURE.DAT is an ASCII input file that is read by BRAGFLO if creep closure is to be simulated. If creep closure is not to be simulated a dummy file must be included even though this dummy file will not be read. The user is responsible for the creation of a file with porosity surface information. It is not generated by PREBRAG, but a .CSD file is generated by the SANTOS software module, which can be used as the BRAGFLO 6.0 input file.

6.4.4 Test Results

Regression testing is used for Test Case #4 to show that the acceptance criteria for BRAGFLO 6.0 have been satisfied. The ASCII output file, BF2_QB0600_ES47_TEST4.OUT, from Test Case #4 of BRAGFLO 6.0 run on the ES47 is compared to the output file, BF2_VMS82_V500_ES47_TEST4.OUT (Nemer, 2006), using the VMS DIFFERENCE command. The results are stored in BF2_QB0600_ES47_TEST4_OUT.DIF, which is shown in Appendix A.4.3, with differences due to reporting of new input information indicated in bold italics. A summary of differences is listed in Figure 6.4.4.

FIGURE 6.4.4 Summary of Difference Statistics for Test Case #4

```

- Difference in dates and times, file and directory names, code version and date, and execution statistics: 12 sections;

- Differences due to new input: 6 sections.

The ASCII output files, BF2_QB0600_ES40_TEST4.OUT and BF2_QB0600_ES45_TEST4.OUT, from Test Case #4 of BRAGFLO 6.0 run on the ES40 and ES45, respectively, were compared to the output file, BF2_QB0600_ES47_TEST4.OUT, using the VMS DIFFERENCE command, with the results stored in BF2_QB0600_ES40_TEST4_OUT.DIF and BF2_QB0600_ES45_TEST4_OUT.DIF (Appendix A.4.4), respectively. Examinations of these files show that there are no differences other than run dates and times, file and directory names, platform names, and execution statistics.

There are no unacceptable differences in values of output variables for Test Case #4 between BRAGFLO 6.0 and BRAGFLO 5.0 running on the OpenVMS 8.2 operating system. Visual inspection of the ASCII output files confirmed that the input that describes the test case is read correctly. Based on the comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified for Test Case #4 in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.

6.5 Test Case #5. Two-Dimensional, Two-Phase Flow With Gas Injection.

6.5.1 Test Objective

The purpose of this test is to verify the ability of BRAGFLO to model gas injection (or generation) and the subsequent migration of gas in a two-phase system (Functional Requirements R.15 and R.16). This problem consists of a two-dimensional vertical cross section with a gas injection well located at the center of a 22m by 21m region. Because of symmetry with respect to a vertical plane through the well, only the solution on the right half of the region needs to be obtained, so a 11m by 21m region is modeled. The reservoir is initialized to gravity/capillary equilibrium. Gas is injected at a constant rate from initial time until time 1.0×10^7 s. TOUGH was run on the same problem to provide a comparison of the BRAGFLO results. The TOUGH results are shown in Figures 9.5.1 to 9.5.4. In addition, this test case tests the basic Functional Requirements R.1 to R.3, R.5 to R.7, and R.18, which describe the problem being tested, and R.11 to R.12, the equations of state for the fluids.

6.5.2 Test Procedure

Test Case #5 is run using the WIPP PA run control system. The scripts, script input files, and all other files related to validation testing of BRAGFLO 6.0 reside in QB0600 class of the CMS library, LIBBF. All test inputs are fetched at run time by the scripts, and test outputs/results and run logs are automatically stored by the scripts in the CMS library. The test case is run on each of the three platforms, ES40, ES45 and ES47. Excerpts from the BRAGFLO 6.0, Test Case #5, .LOG files, BF2_QB0600_ES40_TEST5_RUN.LOG, BF2_QB0600_ES45_TEST5_RUN.LOG and BF2_QB0600_ES47_TEST5_RUN.LOG are included in Appendix A.5.1. These indicate the files that are used or generated.

To validate BRAGFLO 6.0 on all three platforms, the following procedure is performed for Test Case #5.

1) Validation test results from BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 5.0 run on the ES47 with OpenVMS 8.2 (Nemer, 2006).
2) Validation test results from BRAGFLO 6.0 run on the ES40 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.
3) Validation test results from BRAGFLO 6.0 run on the ES45 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

The VMS DIFFERENCE command is used to compare the output file from BRAGFLO 6.0 to the corresponding output file as outlined above. Differences are recorded in ASCII files. Differences that involve dates and times, file and directory names, platform names, code version and date, and execution statistics are deemed to be acceptable. In addition, differences, involving the reporting of new input information for BRAGFLO 6.0 in the output files, are acceptable and desirable, because they improve documentation of analyses. Numerical differences, if any, are evaluated according the requirements of the BRAGFLO 6.0 RD/VVP (Nemer, 2007).

The results from the validation test of BRAGFLO 5.0 on the ES47 running OpenVMS 8.2 were determined valid by comparison to the output from the validation of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 (Nemer, 2006). The output of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 was determined to be valid by comparison to the output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 (Stein; Zelinski, 2004b). The output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 was determined valid by comparison to the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 (Fox; Trone, 2003). In turn, the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 was determined to be valid by comparison to the output of the validation of BRAGFLO 4.10, done on an Alpha 2100 running OpenVMS 6.1 (Hanson; Fox; Trone, 2003). In the validation for Test Case #5 for BRAGFLO 4.10, the acceptance criteria were comparisons with other independently developed software of similar purpose (i. e., TOUGH), together with manual inspection of the output from the test case (Schreiber 1997a). The code BF2_TEST5_BFDAT.FOR was run to extract pressure and saturation data from the output file, BF2_TEST5.OUT, at time 1.0×10^7 s, the final printout time, and create data files, which were input to the plotting software, SPLAT. The resulting plots superimposed BRAGFLO results and the independent results. Numerical comparisons were also performed.

6.5.3 Input Files

Two types of input files are required to run BRAGFLO 6.0. The first input file, BF2_QB0600_TEST5.INP, is an ASCII control file generated by the PREBRAG software module and is shown in Appendix A.5.2. This file is generated by modifying the input file, BF2_TEST5_QA0500.INP, which was used in the validation of BRAGFLO 5.0, for the new input information for BRAGFLO 6.0. The VMS DIFFERENCE command is used to compare these two files and the differences are recorded in the ASCII file, BF2_QB0600_ES47_TEST5_INP.DIF (Figure 6.5.5). As seen in Figure 6.5.5, the differences between the input files consist of six sections that correspond to the new input information for BRAGFLO 6.0. The first and second sections contain flags to write the new output variables for BRAGFLO 6.0 to the ASCII and binary files (which are disabled with the values all set to 0). The third section contains the input of the initial MgO concentration (with the values all set to zero), while the next section shows the input for the material change reset model (with the model disabled by the 0 in the input). The fifth section contains the input parameters for permeability models 11 and 12 (which are not used in this testcase), as well as for the smooth permeability model (with the model disabled by the 0 in the input). The last section contains the input parameters for the chemistry models, which are all disabled for this testcase.

```

The second input file, BF2_CLOSURE.DAT, contains the closure surface data required by BRAGFLO to define the creep closure surface within the repository. The same input file is used for all 14 test cases. It is too wide to fit the format of a written report, but it is stored in class QB0600 of the CMS library. BF2_CLOSURE.DAT is an ASCII input file that is read by BRAGFLO if creep closure is to be simulated. If creep closure is not to be simulated a dummy file must be included even though this dummy file will not be read. The user is responsible for the creation of a file with porosity surface information. It is not generated by PREBRAG, but a .CSD file is generated by the SANTOS software module, which can be used as the BRAGFLO 6.0 input file.

6.5.4 Test Results

Regression testing is used for Test Case #5 to show that the acceptance criteria for BRAGFLO 6.0 have been satisfied. The ASCII output file, BF2_QB0600_ES47_TEST5.OUT, from Test Case #5 of BRAGFLO 6.0 run on the ES47 is compared to the output file, BF2_VMS82_V500_ES47_TEST5.OUT (Nemer, 2006), using the VMS DIFFERENCE command. The results are stored in BF2_QB0600_ES47_TEST5_OUT.DIF, which is shown in Appendix A.5.3, with differences due to reporting of new input information indicated in bold italics. A summary of differences is listed in Figure 6.5.6.

FIGURE 6.5.6 Summary of Difference Statistics for Test Case #5

```
Number of difference sections found: 17
Number of difference records found: 205

DIFFERENCES /IGNORE=(SPACING,TRAILING_SPACES,BLANK_LINES)/MERGED=1/OUTPUT=-
    PAA:[ANALYSIS.BF.QB0600.ES47.TEST5]BF2_QB0600_ES47_TEST5_OUT.DIF;1-
    PAA:[ANALYSIS.BF.QB0600.ES47.TEST5]BF2_QB0600_ES47_TEST5.OUT;1-
    PAA:[ANALYSIS.BF.QB0600.ES47.TEST5]BF2_VMS82_V500_ES47_TEST5.OUT;1
```

- Difference in dates and times, file and directory names, code version and date, and execution statistics: 11 sections;
- Differences due to new input: 6 sections.

The ASCII output files, BF2_QB0600_ES40_TEST5.OUT and BF2_QB0600_ES45_TEST5.OUT, from Test Case #5 of BRAGFLO 6.0 run on the ES40 and ES45, respectively, are compared to the output file, BF2_QB0600_ES47_TEST5.OUT, using the VMS DIFFERENCE command, with the results stored in BF2_QB0600_ES40_TEST5_OUT.DIF and BF2_QB0600_ES45_TEST5_OUT.DIF (Appendix A.5.4), respectively. Examinations of these files show that there are no differences other than run dates and times, file and directory names, platform names, and execution statistics.

There are no unacceptable differences in values of output variables for Test Case #5 between BRAGFLO 6.0 and BRAGFLO 5.0 running on the OpenVMS 8.2 operating system. Visual inspection of the ASCII output files confirmed that the input that describes the test case is read correctly. Based on the comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified for Test Case #5 in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.

6.6 Test Case #6. Two-dimensional WIPP Preliminary Performance Assessment Calculation.

6.6.1 Test Objective

The purpose of this test is to exercise functional requirements that are specific to WIPP performance assessment calculations, but which were not tested in Test Cases 1-5. These include tests of:

1) gas generation resulting from corrosion and biodegradation reactions [Functional Requirement R.13];
2) creep closure of the repository [R.14];
3) fracturing of interbeds [R.9];
4) Klinkenberg effect [R.10];
5) relative permeability and capillary pressure models [R.8];
6) gas and brine density calculations [R.11 and R.12];
7) porosity calculations in materials other than waste [R.7 and R.9];
8) introduction of a borehole at the time of a human intrusion [R.7];
9) binary and ASCII output file generation [R.18];
10) reading an input file prepared by PREBRAG [R.25];
11) postprocessing using POSTBRAG [R.27].
12) reading an closure-surface input file prepared in SANTOS [R.26]

Functional Requirement R.17 (flow in heterogeneous materials) is not tested explicitly because this test case is too complex to be a valid test of that feature, but R.17 is utilized extensively in this test. In addition, this test case tests the basic Functional Requirements R.1 to R.3, and R.5 to R.6, which describe the problem being tested, R.11 and R.12, the equations of state for fluids, and R.15, the calculation of two-phase flow.

This test case is modification of a single realization from a Latin hypercube sampling used in a preliminary performance assessment calculation. It is expected to be similar to an actual compliance calculation using BRAGFLO in that all the features to be used in compliance calculations will be in effect. The test case simulates a human intrusion into the WIPP repository 1000 years after the repository is decommissioned (E1 scenario) and covers the 10,000-year compliance period. It is similar to Vector 7 of Test Case #7 except that Test Case #6 uses higher corrosion and biodegradation rates in order to generate sufficient pressures for fracturing to occur.

6.6.2 Test Procedure

Test Case #6 is run using the WIPP PA run control system. The scripts, script input files, and all other files related to validation testing of BRAGFLO 6.0 reside in QB0600 class of the CMS library, LIBBF. All test inputs are fetched at run time by the scripts, and test outputs/results and run logs are automatically stored by the scripts in the CMS library. The test case is run on each of the three platforms, ES40, ES45 and ES47. Excerpts from the BRAGFLO 6.0, Test Case #6,

.LOG files, BF2_QB0600_ES40_TEST6_RUN.LOG, BF2_QB0600_ES45_TEST6_RUN.LOG and BF2_QB0600_ES47_TEST6_RUN.LOG are included in Appendix A.6.1. These indicate the files that are used or generated.

To validate BRAGFLO 6.0 on all three platforms, the following procedure is performed for Test Case #6.

1) Validation test results from BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 5.0 run on the ES47 with OpenVMS 8.2 (Nemer, 2006).
2) Validation test results from BRAGFLO 6.0 run on the ES40 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.
3) Validation test results from BRAGFLO 6.0 run on the ES45 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

The VMS DIFFERENCE command is used to compare the output file from BRAGFLO 6.0 to the corresponding output file as outlined above. Differences are recorded in ASCII files. Differences that involve dates and times, file and directory names, platform names, code version and date, and execution statistics are deemed to be acceptable. In addition, differences, involving the reporting of new input information for BRAGFLO 6.0 in the output files, are acceptable and desirable, because they improve documentation of analyses. Numerical differences, if any, are evaluated according the requirements of the BRAGFLO 6.0 RD/VVP (Nemer, 2007).

The results from the validation test of BRAGFLO 5.0 on the ES47 running OpenVMS 8.2 were determined valid by comparison to the output from the validation of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 (Nemer, 2006). The output of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 was determined to be valid by independent calculations and manual inspection of the output (Stein; Zelinski, 2004b). The binary output file was post-processed using POSTBRAG, with an input .CDB file, BF2_TEST6_ALGEBRA.CDB, to produce an output .CDB file, BF2_QB0600_TEST6.CDB, which can be examined using GROPE or SPLAT.

6.6.3 Input Files

Two types of input files are required to run BRAGFLO 6.0. The first input file, BF2_QB0600_TEST6.INP, is an ASCII control file generated by the PREBRAG software module and is shown in Appendix A.6.2. This file is generated by modifying the input file, BF2_TEST6_QA0500.INP, which was used in the validation of BRAGFLO 5.0, for the new input information for BRAGFLO 6.0. The VMS DIFFERENCE command is used to compare these two files and the differences are recorded in the ASCII file, BF2_QB0600_ES47_TEST6_INP.DIF (Figure 6.6.1). As seen in Figure 6.6.1, the differences between the input files consist of thirteen sections that correspond to the new input information for BRAGFLO 6.0. The first and second sections contain flags to write the new output variables for BRAGFLO 6.0 to the ASCII and binary files. The order of the flags changed in BRAGFLO

6.0, but the input file flags are set to output the same variables as before. The third section contains the input of the initial MgO concentration (with the values all set to zero). Sections 4 to 11 shows changes made for the waste area reset model. This model is improved to enable more materials to be reset, instead of being limited to the waste materials (i.e. the shaft, open drifts, etc.) Material #10 CAVITY_4 had two different reset saturations which necessitated the introduction of a new material labeled #39 CAVITY_5 to represent both saturations. Material #39 is given the same properties as #10 (which it replaced in three cells), except for the reset saturation. Section 4 shows the replacement of material #10 with #39. Sections 5, 9, 10 and 11 show the added properties for material #39. Sections 6, 7, and 8 show the reset parameters added for the model change. The values are set to give the same conditions as are given before for the testcase. Section 8 also shows the input for the material change reset model (with the model disabled by the 0 in the input). Section 11 also contains the input parameters for permeability models 11 and 12 (which are not used in this testcase), as well as for the smooth permeability model (with the model disabled by the 0 in the input). Section 12 contains the input parameters for the chemistry models, which are set to the previous testcase values, except for RKCOR and RKBIO, which are divided by the initial concentration of Fe and cellulose, respectively, to test the intrinsic rate flag. The last section contains the inputs for the closure model, which contains the same values as before, but in a different input structure.

The second input file, BF2_CLOSURE.DAT, contains the closure surface data required by BRAGFLO to define the creep closure surface within the repository. The same input file is used for all 14 test cases. It is too wide to fit the format of a written report, but it is stored in class QB0600 of the CMS library. BF2_CLOSURE.DAT is an ASCII input file that is read by BRAGFLO if creep closure is to be simulated. If creep closure is not to be simulated a dummy file must be included even though this dummy file will not be read. The user is responsible for the creation of a file with porosity surface information. It is not generated by PREBRAG, but a .CSD file is generated by the SANTOS software module, which can be used as the BRAGFLO 6.0 input file.

6.6.4 Test Results

Regression testing is used for Test Case #6 to show that the acceptance criteria for BRAGFLO 6.0 have been satisfied. The ASCII output file, BF2_QB0600_ES47_TEST6.OUT, from Test Case #6 of BRAGFLO 6.0 run on the ES47 is compared to the output file, BF2_VMS82_V500_ES47_TEST6.OUT (Nemer, 2006), using the VMS DIFFERENCE command. The results are stored in BF2_QB0600_ES47_TEST6_OUT.DIF, which is shown in Appendix A.6.3, with differences due to reporting of new input information indicated in bold italics. A summary of differences is listed in Figure 6.6.2.

FIGURE 6.6.2 Summary of Difference Statistics for Test Case #6

```

- Difference in dates and times, file and directory names, code version and date, and execution statistics: 17 sections;
- Differences due to new input: 12 sections.

The ASCII output files, BF2_QB0600_ES40_TEST6.OUT and BF2_QB0600_ES45_TEST6.OUT, from Test Case #6 of BRAGFLO 6.0 run on the ES40 and ES45, respectively, are compared to the output file, BF2_QB0600_ES47_TEST6.OUT, using the VMS DIFFERENCE command, with the results stored in BF2_QB0600_ES40_TEST6_OUT.DIF and BF2_QB0600_ES45_TEST6_OUT.DIF (Appendix A.6.4), respectively. Examinations of these files show that there are no differences other than run dates and times, file and directory names, platform names, and execution statistics.

There are no unacceptable differences in values of output variables for Test Case #6 between BRAGFLO 6.0 and BRAGFLO 5.0 running on the OpenVMS 8.2 operating system. Visual inspection of the ASCII output files confirmed that the input that describes the test case is read correctly. Based on the comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified for Test Case #6 in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.

6.7 Test Case #7. FEP baseline calculations, E1 scenario. (Total of 20 BRAGFLO runs)

6.7.1 Test Objective

The purpose of this test is to verify that BRAGFLO can simulate the performance of the WIPP site using wide ranges of the parameters that will likely be varied in a compliance calculation. Gas pressures, for example, should be positive everywhere and bounded within reasonable limits (say, 30 MPa). In the waste and other excavated regions, the pressures should start at atmospheric and increase over time, generally ending up, at 10,000 years between 6 MPa and 15 MPa (approximately, between hydrostatic and lithostatic pressures).

All of the features, that are expected to be used in compliance calculations, will be exercised in each run. Thus, all Functional Requirements except R.16 (well models), R.17 (flow through heterogeneous and homogenous media), R.19 (an error check), and R.20-R.24 (new for BRAGFLO 6.0) are tested, with the objective being simply to show, when all features are activated, that the results are reasonable. This is in contrast to other test cases in which certain output variables are examined in detail. The test consists of 20 separate BRAGFLO runs, a complete set from a Latin hypercube sampling (LHS). Each run simulates the behavior of the WIPP site over a 10,000-year period, with a human intrusion occurring at 1000 years, the E1 scenario.

6.7.2 Test Procedure

Test Case #7 is run using the WIPP PA run control system. The scripts, script input files, and all other files related to validation testing of BRAGFLO 6.0 reside in QB0600 class of the CMS library, LIBBF. All test inputs are fetched at run time by the scripts, and test outputs/results and run logs are automatically stored by the scripts in the CMS library. The test case is run on each of the three platforms, ES40, ES45 and ES47. Excerpts from the BRAGFLO 6.0, Test Case #7, .LOG files, BF2_QB0600_ES40_TEST7_Vnnn_RUN.LOG (where nnn = 001 to 020, 20 files), BF2_QB0600_ES45_TEST7_Vnnn_RUN.LOG (20 files) and BF2_QB0600_ES47_TEST7_Vnnn_RUN.LOG (20 files) are included in Appendix A.7.1. These indicate the files that are used or generated.

To validate BRAGFLO 6.0 on all three platforms, the following procedure is performed for Test Case #7.

1) Validation test results from BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 5.0 run on the ES47 with OpenVMS 8.2 (Nemer, 2006).
2) Validation test results from BRAGFLO 6.0 run on the ES40 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.
3) Validation test results from BRAGFLO 6.0 run on the ES45 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

The VMS DIFFERENCE command is used to compare the output file from BRAGFLO 6.0 to the corresponding output file as outlined above. Differences are recorded in ASCII files. Differences that involve dates and times, file and directory names, platform names, code version and date, and execution statistics are deemed to be acceptable. In addition, differences, involving the reporting of new input information for BRAGFLO 6.0 in the output files, are acceptable and desirable, because they improve documentation of analyses. Numerical differences, if any, are evaluated according the requirements of the BRAGFLO 6.0 RD/VVP (Nemer, 2007).

The results from the validation test of BRAGFLO 5.0 on the ES47 running OpenVMS 8.2 were determined valid by comparison to the output from the validation of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 (Nemer, 2006). The output of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 was determined to be valid by manual inspection of the output (Stein; Zelinski, 2004b).

6.7.3 Input Files

Two types of input files are required to run BRAGFLO 6.0. The first type of input file, BF2_QB0600_TEST7_Vnnn.INP (20 files), are ASCII control files generated by the PREBRAG software module and are shown in Appendix A.7.2. These files are generated by modifying the input file, BF2_TEST7_Rnnn _QA0500.INP (where nnn = 001 to 020, 20 files), which was used in the validation of BRAGFLO 5.0, for the new input information for BRAGFLO 6.0. The VMS DIFFERENCE command is used to compare these files and the differences are recorded in the ASCII file, BF2_QB0600_ES47_TEST7_Vnnn_INP.DIF (20 files, Appendix A.7.3). A summary of the differences is listed in Figure 6.7.1. As seen in Figure 6.7.1, each of the 20 files contained twelve sections of differences that correspond to the new input information for BRAGFLO 6.0. The first section contains flags to write the new output variables for BRAGFLO 6.0 to the ASCII and binary files. The order of the flags changed in BRAGFLO 6.0, but the input file flags are set to output the same variables as before. The second section contains the input of the initial MgO concentration (with the values all set to zero). Sections 3 to 10 shows changes made for the waste area reset model. This model is improved to enable more materials to be reset, instead of being limited to the waste materials (i.e. the shaft, open drifts, etc.) Material #10 CAVITY_4 had two different reset saturations which necessitated the introduction of a new material labeled #39 CAVITY_5 to represent both saturations. Material #39 is given the same properties as #10 (which it replaced in three cells), except for the reset saturation. Section 3 shows the replacement of material #10 with #39. Sections 4, 8, 9 and 10 show the added properties for material #39. Sections 5, 6, and 7 show the reset parameters added for the model change. The values are set to give the same conditions as are given before for the testcase. Section 7 also shows the input for the material change reset model (with the model disabled by the 0 in the input). Section 10 also contains the input parameters for permeability models 11 and 12 (which are not used in this testcase), as well as for the smooth permeability model (with the model disabled by the 0 in the input). Section 11 contains the input parameters for the chemistry models, which are set to the previous testcase values. The last section contains the inputs for the closure model, which contains the same values as before, but in a different input structure.

The second input file, BF2_CLOSURE.DAT, contains the closure surface data required by BRAGFLO to define the creep closure surface within the repository. The same input file is used for all 14 test cases. It is too wide to fit the format of a written report, but it is stored in class QB0600 of the CMS library. BF2_CLOSURE.DAT is an ASCII input file that is read by BRAGFLO if creep closure is to be simulated. If creep closure is not to be simulated a dummy file must be included even though this dummy file will not be read. The user is responsible for the creation of a file with porosity surface information. It is not generated by PREBRAG, but a .CSD file is generated by the SANTOS software module, which can be used as the BRAGFLO 6.0 input file.

6.7.4 Test Results

Regression testing is used for Test Case #7 to show that the acceptance criteria for BRAGFLO 6.0 have been satisfied. The ASCII output files, BF2_QB0600_ES47_TEST7_Vnnn.OUT (20 files), from Test Case #7 of BRAGFLO 6.0 run on the ES47 are compared to the output file, BF2_VMS82_V500_ES47_TEST7_Rnnn.OUT (20 files, Nemer, 2006), using the VMS DIFFERENCE command. The results are stored in BF2_QB0600_ES47_TEST7_Vnnn.DIF (20 files), with differences due to reporting of new input information indicated in bold italics (Appendix A.7.4). A summary of differences is listed in Figure 6.7.2.

FIGURE 6.7.2 Summary of Difference Statistics for Test Case #7

BF2_QB0600_ES47_TEST7_V001.DIF

```
Number of difference sections found: 23

The ASCII output files, BF2_QB0600_ES40_TEST7_Vnnn.OUT (20 files) and BF2_QB0600_ES45_TEST7_Vnnn.OUT (20 files), from Test Case #7 of BRAGFLO 6.0 run on the ES40 and ES45, respectively, are compared to the output files, BF2_QB0600_ES47_TEST7_Vnnn.OUT (20 files), using the VMS DIFFERENCE command, with the results are stored in BF2_QB0600_ES40_TEST7_Vnnn.DIF (20 files, Appendix A.7.5) and BF2_QB0600_ES45_TEST7_Vnnn.DIF (20 files, Appendix A.7.5), respectively. Examination of these files shows that there are no differences other than run dates and times, file and directory names, platform names, and execution statistics.

There are no unacceptable differences in values of output variables for Test Case #7 between BRAGFLO 6.0 and BRAGFLO 5.0 running on the OpenVMS 8.2 operating system. Visual inspection of the ASCII output files confirmed that the input that describes the test case is read correctly. Based on the comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified for Test Case #7 in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.

6.8 Test Case #8. Well Production at Specified Bottom Hole Pressure

6.8.1 Test Objective

The purpose of this test is to verify that BRAGFLO can simulate the performance of production wells in which the bottom hole pressure is specified, in particular when two phases are present.

This type of well model is often used in BRAGFLO to maintain a constant pressure at some location. Dirichlet boundary conditions can achieve the same result somewhat more rigorously. However, the well model has the advantage that conditions can be changed during the course of a run, whereas the Dirichlet conditions are fixed for the entire run. In addition, the outflows, or production from the well, is calculated and can be output, something not done when the Dirichlet conditions are used.

The well model in BRAGFLO treats well deliverability by the inflow performance equation:

$$q_l = I\left(\frac{k_{rl}}{\mu_l}\right)\left(p_l - p_{wf}\right) \tag{6.8.1}$$

where

q = volumetric flow rate [m^3/s],
I = well productivity index [m^3],
k_r = relative permeability [-],
μ = viscosity [Pa·s],
p = pressure [Pa],

and subscripts

l = phase (brine or gas),
wf = flowing bottom hole.

To test the BRAGFLO treatment of well production at specified bottom hole pressure, a test was designed and the BRAGFLO results are compared with the results obtained from the code TOUGH28W, which is the WIPP version of the TOUGH code (Pruess, 1987).

The test problem considers a horizontal one-dimensional reservoir with two grid blocks. Each grid block is a 10 *m* cube. Both grid blocks are initially at pressure 10 MPa and water saturation 0.5. Fluids consist of pure water and hydrogen gas. A single well with productivity index of 1.0×10^{-12} m^3 is completed in the first grid block at initial time and is produced for 1000 s at a fixed flowing bottom hole pressure of 1.0 MPa. The well will produce both water and gas with declining rates as the reservoir is depleted and the pressure decreases. Formation properties are:

permeability	$= 1.0 \times 10^{-13}$ m^2,
porosity	= 0.5,
rock compressibility	= 0.0 Pa^{-1},
capillary pressure	= 0.0 Pa.

Relative permeability's are given by the Brooks-Corey model (KRP = 4) with pore distribution parameter $\lambda = 0.7$ and residual water and gas saturations of zero.

Results from TOUGH28W are shown in Figures 6.8.1 to 6.8.3. Both water and gas are produced from the well grid block (grid block #1). As pressure is depleted from the well block, supporting flow from the second grid block occurs. Both grid blocks become depleted, but the well block maintains a pressure below the adjacent grid block, as shown in Figure 6.8.1. As the pressure declines, both the water and gas production rates (Figures 6.8.2 and 6.8.3, respectively) decline. Tabulated results from TOUGH28W are shown in Table 6.8.1.

Some differences exist between BRAGFLO and TOUGH28W that cannot be compensated for with input data. Fluid properties are represented differently. BRAGFLO uses a constant brine compressibility to compute brine density whereas TOUGH28W uses an equation of state for brine density. It was estimated from TOUGH28W brine density data that the equivalent brine compressibility to use in BRAGFLO was 4.45×10^{-10} Pa^{-1}. Fluid viscosity in TOUGH28W is pressure-dependent, whereas BRAGFLO uses constant water and gas viscosity, 8.5×10^{-2} Pa·s and 8.92×10^{-6} Pa·s, respectively. These values were chosen as representative of the values used in TOUGH28W throughout the pressure range encountered. The two codes also implement a different technique for averaging interblock flows, which will contribute to differences in the calculated fluid flows. This test case tests Functional Requirement R.16 and R.18.

6.8.2 Test Procedure

Test Case #8 is run using the WIPP PA run control system. The scripts, script input files, and all other files related to validation testing of BRAGFLO 6.0 reside in QB0600 class of the CMS library, LIBBF. All test inputs are fetched at run time by the scripts, and test outputs/results and run logs are automatically stored by the scripts in the CMS library. The test case is run on each of the three platforms, ES40, ES45 and ES47. Excerpts from the BRAGFLO 6.0, Test Case #8, .LOG files, BF2_QB0600_ES40_TEST8_RUN.LOG, BF2_QB0600_ES45_TEST8_RUN.LOG and BF2_QB0600_ES47_TEST8_RUN.LOG are included in Appendix A.8.1. These indicate the files that are used or generated.

To validate BRAGFLO 6.0 on all three platforms, the following procedure is performed for Test Case #8.

1) Validation test results from BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 5.0 run on the ES47 with OpenVMS 8.2 (Nemer, 2006).
2) Validation test results from BRAGFLO 6.0 run on the ES40 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

3) Validation test results from BRAGFLO 6.0 run on the ES45 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

The VMS DIFFERENCE command is used to compare the output file from BRAGFLO 6.0 to the corresponding output file as outlined above. Differences are recorded in ASCII files. Differences that involve dates and times, file and directory names, platform names, code version and date, and execution statistics are deemed to be acceptable. In addition, differences, involving the reporting of new input information for BRAGFLO 6.0 in the output files, are acceptable and desirable, because they improve documentation of analyses. Numerical differences, if any, are evaluated according the requirements of the BRAGFLO 6.0 RD/VVP (Nemer, 2007).

The results from the validation test of BRAGFLO 5.0 on the ES47 running OpenVMS 8.2 were determined valid by comparison to the output from the validation of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 (Nemer, 2006). The output of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 was determined to be valid by comparison to the output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 (Stein; Zelinski, 2004b). The output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 was determined valid by comparison to the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 (Fox; Trone, 2003). In turn, the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 was determined to be valid by comparison to the output of the validation of BRAGFLO 4.10, done on an Alpha 2100 running OpenVMS 6.1 (Hanson; Fox; Trone, 2003). In the validation for Test Case #8 for BRAGFLO 4.10, the acceptance criteria were comparisons with other independently developed software of similar purpose (i. e., TOUGH), together with manual inspection of the output from the test case (Schreiber 1997a). The code BF2_TEST8_POST.FOR was run to extract pressures, saturations, and time-average well flow rates of water and gas from the ASCII output file, BF2_TEST8.OUT, and places this information into files used by the plotting package, SPLAT. The resulting plots superimposed BRAGFLO results and the independent results. Numerical comparisons were also performed.

6.8.3 Input Files

Two types of input files are required to run BRAGFLO 6.0. The first input file, BF2_QB0600_TEST8.INP, is an ASCII control file generated by the PREBRAG software module and is shown in Appendix A.8.2. This file is generated by modifying the input file, BF2_TEST8_QA0500.INP, which was used in the validation of BRAGFLO 5.0, for the new input information for BRAGFLO 6.0. The VMS DIFFERENCE command is used to compare these two files and the differences are recorded in the ASCII file, BF2_QB0600_ES47_TEST8_INP.DIF (Figure 6.8.4). As seen in Figure 6.8.4, the differences between the input files consist of four sections that correspond to the new input information for BRAGFLO 6.0. The first section contains the input of the initial MgO concentration (with the values all set to zero), while the next section shows the input for the material change reset model (with the model disabled by the 0 in the input). The third section contains the input parameters for permeability models 11 and 12 (which are not used in this testcase), as well as for the smooth permeability model (with the model disabled by the 0 in the input). The last section contains the input parameters for the chemistry models, which are all disabled for this testcase.

The second input file, BF2_CLOSURE.DAT, contains the closure surface data required by BRAGFLO to define the creep closure surface within the repository. The same input file is used for all 14 test cases. It is too wide to fit the format of a written report, but it is stored in class QB0600 of the CMS library. BF2_CLOSURE.DAT is an ASCII input file that is read by BRAGFLO if creep closure is to be simulated. If creep closure is not to be simulated a dummy file must be included even though this dummy file will not be read. The user is responsible for the creation of a file with porosity surface information. It is not generated by PREBRAG, but a .CSD file is generated by the SANTOS software module, which can be used as the BRAGFLO 6.0 input file.

6.8.4 Test Results

Regression testing is used for Test Case #8 to show that the acceptance criteria for BRAGFLO 6.0 have been satisfied. The ASCII output file, BF2_QB0600_ES47_TEST8.OUT, from Test Case #8 of BRAGFLO 6.0 run on the ES47 is compared to the output file, BF2_VMS82_V500_ES47_TEST8.OUT (Nemer, 2006), using the VMS DIFFERENCE command. The results are stored in BF2_QB0600_ES47_TEST8_OUT.DIF, which is shown in Appendix A.8.3, with differences due to reporting of new input information indicated in bold italics. A summary of differences is listed in Figure 6.8.5.

- Difference in dates and times, file and directory names, code version and date, and execution statistics: 28 sections;
- Differences due to new input: 6 sections.

The ASCII output files, BF2_QB0600_ES40_TEST8.OUT and BF2_QB0600_ES45_TEST8.OUT, from Test Case #8 of BRAGFLO 6.0 run on the ES40 and

ES45, respectively, are compared to the output file, BF2_QB0600_ES47_TEST8.OUT, using the VMS DIFFERENCE command, with the results stored in BF2_QB0600_ES40_TEST8_OUT.DIF and BF2_QB0600_ES45_TEST8_OUT.DIF (Appendix A.8.4), respectively. Examinations of these files show that there are no differences other than run dates and times, file and directory names, platform names, and execution statistics.

There are no unacceptable differences in values of output variables for Test Case #8 between BRAGFLO 6.0 and BRAGFLO 5.0 running on the OpenVMS 8.2 operating system. Visual inspection of the ASCII output files confirmed that the input that describes the test case is read correctly. Based on the comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified for Test Case #8 in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.

6.9 Test Case #9. Heterogeneous Reservoir Conditions

6.9.1 Test Objective

The purpose of this test is to verify that BRAGFLO can simulate fluid flow in a non-uniform formation, in particular, where the permeability is non-uniform. Test Case #9 considers the following one-dimensional steady-state single phase flow problem. A 1-D reservoir is discretized with 15 uniform grid blocks of 1 m dimension in each coordinate direction. An injection well is located in the first (left-most) grid block with water injection rate of 0.1 kg/s. In the 15th (right-most) grid block, a well produces water at a rate of 0.1 kg/s. At initial time, the water pressure within the reservoir is a uniform 1.0 MPa. When steady-state flow is achieved in the reservoir, the velocity must satisfy

$$v_w = -\left(\frac{k}{\mu_w}\right)\frac{dp}{dx} = \frac{q_{inj}}{\rho_w A} \tag{6.9.1}$$

where

v_w	= Darcy velocity [m/s],
k	= formation permeability [m^2],
μ_w	= water viscosity, 0.001 [Pa·s],
dp/dx	= pressure gradient in x-direction [Pa/m],
q_{inj}	= water injection rate, 0.1 [kg/s],
ρ_w	= water density, 1000 [kg/m^3],
A	= area normal to flow, 1.0 [m^2].

First consider the case with uniform formation property:

$$\mathrm{k} = 1.0 \times 10^{-11}\ \mathrm{m}^2 \tag{6.9.2}$$

The pressure gradient is then determined by

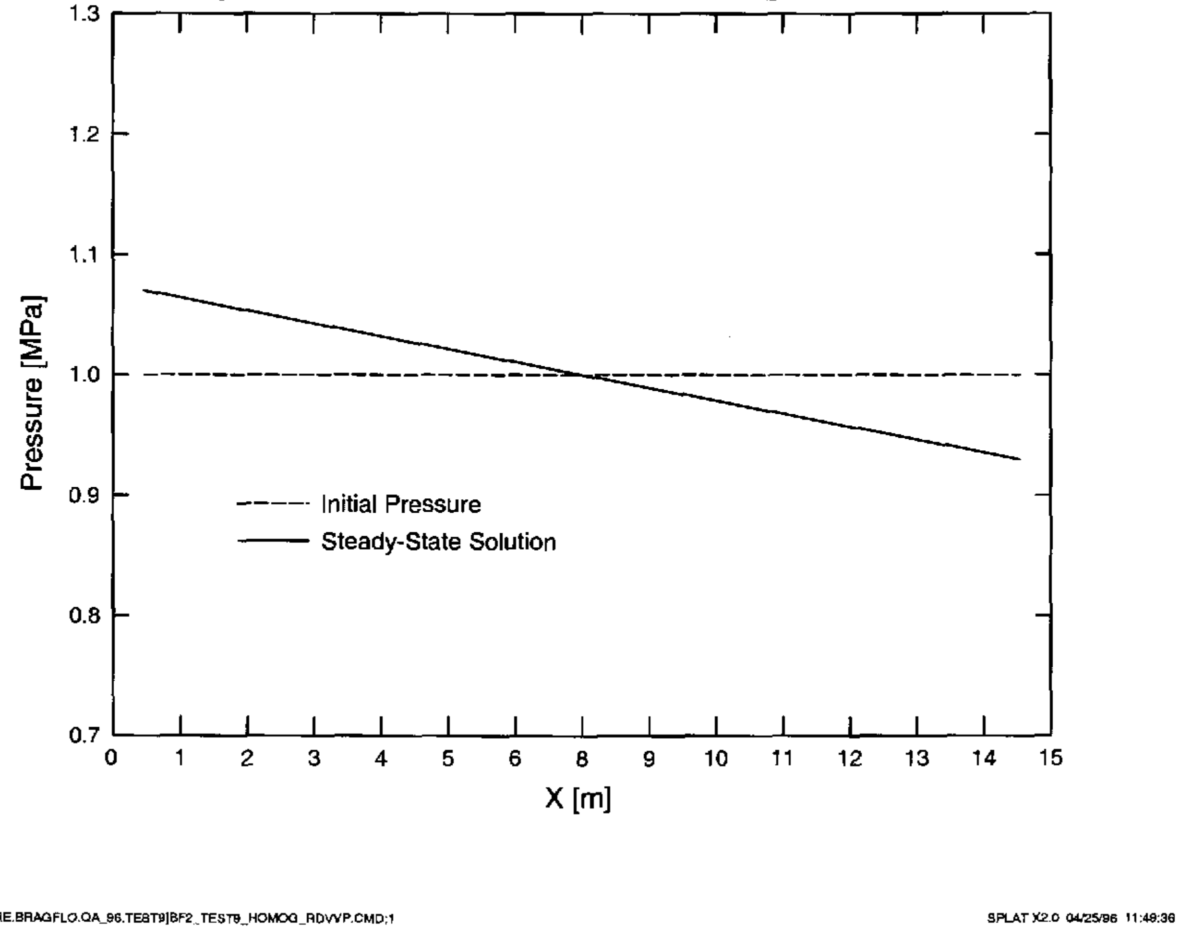
$$\frac{dp}{dx} = -\left(\frac{\mu_w}{k}\right)\frac{q_{inj}}{\rho_w A} \tag{6.9.3}$$

For the above parameter values,

$$\frac{dp}{dx} = -1.0 \times 10^4\ \text{Pa/m} \tag{6.9.4}$$

If the reservoir is allowed to equilibrate over time to a steady state condition, then the pressure at the center of the reservoir (center of grid block 8) will maintain 1.0 MPa pressure, and the pressure gradient within the reservoir will assume the value -1.0×10^4 Pa/m. When BRAGFLO is run to steady state condition (1.0×10^5 s), the results should be the linear pressure profile shown in Figure 6.9.1.

FIGURE 6.9.1 Steady-State Solution for Test Case #9, Homogeneous Reservoir Conditions



Now introduce formation heterogeneity. Within the grid, the permeability is assigned as:

$$\begin{aligned} k &= 0.25 \times 10^{-11}\ \mathrm{m}^2, \text{ for } 0 < x < 5, \\ k &= 1.00 \times 10^{-11}\ \mathrm{m}^2, \text{ for } 5 < x < 10, \\ k &= 0.25 \times 10^{-11}\ \mathrm{m}^2, \text{ for } 10 < x < 15. \end{aligned} \tag{6.9.5}$$

This choice of permeability distribution maintains symmetry about the center of the reservoir. The resulting pressure gradients are:

$$\begin{aligned} dp/dx &= -4.0 \times 10^4 \text{ Pa/m}, \text{ for } 0 < x < 5, \\ dp/dx &= -1.0 \times 10^4 \text{ Pa/m}, \text{ for } 5 < x < 10, \\ dp/dx &= -4.0 \times 10^4 \text{ Pa/m}, \text{ for } 10 < x < 15. \end{aligned} \tag{6.9.6}$$

The steady state solution will maintain 1.0 MPa pressure at the grid center and will honor the above pressure gradients, as shown in Figure 6.9.2. The exact solutions for the homogeneous and heterogeneous problems are tabulated in Table 6.9.1.

This test case tests Functional Requirement R.17 and R.18.

6.9.2 Test Procedure

Test Case #9 is run using the WIPP PA run control system. The scripts, script input files, and all other files related to validation testing of BRAGFLO 6.0 reside in QB0600 class of the CMS library, LIBBF. All test inputs are fetched at run time by the scripts, and test outputs/results and run logs are automatically stored by the scripts in the CMS library. The test case is run on each of the three platforms, ES40, ES45 and ES47. Excerpts from the BRAGFLO 6.0, Test Case #9, .LOG files, BF2_QB0600_ES40_TEST9_HETER_RUN.LOG, BF2_QB0600_ES40_TEST9_HOMOG_RUN.LOG, BF2_QB0600_ES45_TEST9_HETER_RUN.LOG, BF2_QB0600_ES45_TEST9_HOMOG_RUN.LOG, BF2_QB0600_ES47_TEST9_HETER_RUN.LOG, and BF2_QB0600_ES47_TEST9_HOMOG_RUN.LOG are included in Appendix A.9.1. These indicate the files that are used or generated.

To validate BRAGFLO 6.0 on all three platforms, the following procedure is performed for Test Case #9.

1) Validation test results from BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 5.0 run on the ES47 with OpenVMS 8.2 (Nemer, 2006).
2) Validation test results from BRAGFLO 6.0 run on the ES40 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.
3) Validation test results from BRAGFLO 6.0 run on the ES45 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

The VMS DIFFERENCE command is used to compare the output file from BRAGFLO 6.0 to the corresponding output file as outlined above. Differences are recorded in ASCII files. Differences that involve dates and times, file and directory names, platform names, code version and date, and execution statistics are deemed to be acceptable. In addition, differences, involving the reporting of new input information for BRAGFLO 6.0 in the output files, are acceptable and desirable, because they improve documentation of analyses. Numerical differences, if any, are evaluated according the requirements of the BRAGFLO 6.0 RD/VVP (Nemer, 2007).

The results from the validation test of BRAGFLO 5.0 on the ES47 running OpenVMS 8.2 were determined valid by comparison to the output from the validation of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 (Nemer, 2006). The output of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 was determined to be valid by comparison to the output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 (Stein; Zelinski, 2004b). The output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 was determined valid by comparison to the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 (Fox; Trone, 2003). In turn, the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 was determined to be valid by comparison to the output of the validation of BRAGFLO 4.10, done on an Alpha 2100 running OpenVMS 6.1 (Hanson; Fox; Trone, 2003). In the validation for Test Case #9 for BRAGFLO 4.10, the acceptance criteria were comparisons with analytical solutions of the output from the test case (Schreiber 1997a). The codes BF2_TEST9_HOMOG_POST.FOR and BF2_TEST9_HETER_POST.FOR were run to to extract water (brine) pressures and place this information into files used by the plotting package, SPLAT. The resulting plots superimposed BRAGFLO results and the analytical solutions. Numerical comparisons were also performed.

6.9.3 Input Files

Two types of input files are required to run BRAGFLO 6.0. The first type of input file, BF2_QB0600_TEST9_HOMOG.INP and BF2_QB0600_TEST9_HETER.INP, are ASCII control files generated by the PREBRAG software module and are shown in Appendix A.9.2. These files are generated by modifying the input files, BF2_TEST9_HOMOG_QA0500.INP and BF2_TEST9_HETER_QA0500.INP, which were used in the validation of BRAGFLO 5.0, for the new input information for BRAGFLO 6.0. The VMS DIFFERENCE command is used to compare these files and the differences are recorded in the ASCII files, BF2_QB0600_ES47_TEST9_HETER_INP.DIF and BF2_QB0600_ES47_TEST9_HOMOG_INP.DIF (Figure 6.9.3). As seen in Figure 6.9.3, the differences between the input files consist of four sections that correspond to the new input information for BRAGFLO 6.0. The first section contains the input of the initial MgO concentration (with the values all set to zero), while the next section shows the input for the material change reset model (with the model disabled by the 0 in the input). The third section contains the input parameters for permeability models 11 and 12 (which are not used in this testcase), as well as for the smooth permeability model (with the model disabled by the 0 in the input). The last section contains the input parameters for the chemistry models, which are all disabled for this testcase.

The second input file, BF2_CLOSURE.DAT, contains the closure surface data required by BRAGFLO to define the creep closure surface within the repository. The same input file is used for all 14 test cases. It is too wide to fit the format of a written report, but it is stored in class QB0600 of the CMS library. BF2_CLOSURE.DAT is an ASCII input file that is read by BRAGFLO if creep closure is to be simulated. If creep closure is not to be simulated a dummy file must be included even though this dummy file will not be read. The user is responsible for the creation of a file with porosity surface information. It is not generated by PREBRAG, but a .CSD file is generated by the SANTOS software module, which can be used as the BRAGFLO 6.0 input file.

6.9.4 Test Results

Regression testing is used for Test Case #9 to show that the acceptance criteria for BRAGFLO 6.0 have been satisfied. The ASCII output files, BF2_QB0600_ES47_TEST9_HETER.OUT and BF2_QB0600_ES47_TEST9_HOMOG.OUT, from Test Case #9 of BRAGFLO 6.0 run on the ES47 are compared to the output files, BF2_VMS82_V500_ES47_TEST9_HETER.OUT and BF2_VMS82_V500_ES47_TEST9_HOMOG.OUT (Nemer, 2006), using the VMS DIFFERENCE command. The results are stored in BF2_QB0600_ES47_TEST9_HETER_OUT.DIF and BF2_QB0600_ES47_TEST9_HOMOG_OUT.DIF, which are shown in Appendix A.9.3, with differences due to reporting of new input information indicated in bold italics. A summary of differences is listed in Figure 6.9.4.

```

- Difference in dates and times, file and directory names, code version and date, and execution statistics: 12 sections;
- Differences due to new input: 6 sections.

The ASCII output files, BF2_QB0600_ES40_TEST9_HETER.OUT, BF2_QB0600_ES40_TEST9_HOMOG.OUT, from Test Case #9 of BRAGFLO 6.0 run on the

ES40, and BF2_QB0600_ES45_TEST9_HETER.OUT and BF2_QB0600_ES45_TEST9_HOMOG.OUT, from Test Case #9 of BRAGFLO 6.0 run on the ES45, are compared to the output files, BF2_QB0600_ES47_TEST9_HETER.OUT and BF2_QB0600_ES47_TEST9_HOMOG.OUT, using the VMS DIFFERENCE command, with the results are stored in BF2_QB0600_ES40_TEST9_HETER.DIF, BF2_QB0600_ES40_TEST9_HOMOG.DIF, BF2_QB0600_ES45_TEST9_HETER.DIF and BF2_QB0600_ES45_TEST9_HOMOG.DIF (Appendix A.9.4), respectively. Examination of these files shows that there are no differences other than run dates and times, file and directory names, platform names, and execution statistics.

There are no unacceptable differences in values of output variables for Test Case #9 between BRAGFLO 6.0 and BRAGFLO 5.0 running on the OpenVMS 8.2 operating system. Visual inspection of the ASCII output files confirmed that the input that describes the test case is read correctly. Based on the comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified for Test Case #9 in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.

6.10 Test Case #10. No Flow Boundary Conditions

6.10.1 Test Objective

The purpose of this test is to verify that the default no flow boundary conditions are implemented correctly by comparing BRAGFLO results with an analytical solution for a problem that incorporates a no flow boundary. This is a test of Functional Requirement R.4 and R.18.

The problem is a well drawdown in a finite radial reservoir. After the transient period the pressure front will reach the boundary after which time a semi-steady state drawdown will occur. The analytical solution is obtained from the solution of the radial diffusivity equation with constant production rate at the well and a no flow condition at the reservoir exterior boundary (Dake, 1978). The analytical solution for the wellbore pressure drawdown is

$$P - P_{wf} = \left(\frac{q\mu}{2\pi kh}\right)\left[\ln\left(\frac{r}{r_w}\right) - \frac{r^2}{2r_e^2} + \frac{r_w^2}{2r_e^2}\right] \tag{6.10.1}$$

where

P = reservoir pressure [Pa],
P_{wf} = wellbore flowing pressure [Pa],
q = well rate [m^3/s],
μ = water viscosity [Pa s],
k = formation permeability [m^2],
h = formation thickness [m],
r = radius [m],
r_w = well bore radius [m],
r_e = exterior radius to outer boundary [m].

Parameters for this study were taken to be

$q = 0.001$ m^3/s (for BRAGFLO, $q = 1.0$ kg/s, since $\rho_w = 1000$ kg/m^3),
$\mu = 1.8 \times 10^{-3}$ Pa s,
$k = 1.8 \times 10^{-12}$ m^2,
$h = 1.0$ m,
$r_w = 0.01$ m,
$r_e = 100$ m.

The following estimate of the time to obtain semi-steady state is given by (Dake, 1978):

$$t > \frac{\phi\mu c A}{k} \tag{6.10.2}$$

where

ϕ = porosity,0.1,
c = formation compressibility, 1.0×10^{-8} [Pa^{-1}],

A = reservoir area, πr_e^2 [m^2].

The time to semi-steady state is approximately

$$t > \frac{\phi \mu c \pi r_e^2}{k} = \frac{(0.1)(1.8\times10^{-3})(1.0\times10^{-8})\pi(100^2)}{1.8\times10^{-12}} = \pi(10^4)\,\text{s}. \tag{6.10.3}$$

The simulation is run to 1.0×10^5 s.

A plot of the analytical solution is shown in Figure 6.10.1. Numerical values for the analytical solution are shown in Table 6.10.1.

FIGURE 6.10.1 Case #10: Pressure Drawdown at Semi-Steady State Time, t = 105 s.

6.10.2 Test Procedure

Test Case #10 is run using the WIPP PA run control system. The scripts, script input files, and all other files related to validation testing of BRAGFLO 6.0 reside in QB0600 class of the CMS library, LIBBF. All test inputs are fetched at run time by the scripts, and test outputs/results and run logs are automatically stored by the scripts in the CMS library. The test case is run on each of the three platforms, ES40, ES45 and ES47. Excerpts from the BRAGFLO 6.0, Test Case #10, .LOG files, BF2_QB0600_ES40_TEST10_RUN.LOG, BF2_QB0600_ES45_TEST10_RUN.LOG and BF2_QB0600_ES47_TEST10_RUN.LOG are included in Appendix A.10.1. These indicate the files that are used or generated.

To validate BRAGFLO 6.0 on all three platforms, the following procedure is performed for Test Case #10.

1) Validation test results from BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 5.0 run on the ES47 with OpenVMS 8.2 (Nemer, 2006).
2) Validation test results from BRAGFLO 6.0 run on the ES40 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.
3) Validation test results from BRAGFLO 6.0 run on the ES45 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

The VMS DIFFERENCE command is used to compare the output file from BRAGFLO 6.0 to the corresponding output file as outlined above. Differences are recorded in ASCII files. Differences that involve dates and times, file and directory names, platform names, code version and date, and execution statistics are deemed to be acceptable. In addition, differences, involving the reporting of new input information for BRAGFLO 6.0 in the output files, are acceptable and desirable, because they improve documentation of analyses. Numerical differences, if any, are evaluated according the requirements of the BRAGFLO 6.0 RD/VVP (Nemer, 2007).

The results from the validation test of BRAGFLO 5.0 on the ES47 running OpenVMS 8.2 were determined valid by comparison to the output from the validation of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 (Nemer, 2006). The output of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 was determined to be valid by comparison to the output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 (Stein; Zelinski, 2004b). The output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 was determined valid by comparison to the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 (Fox; Trone, 2003). In turn, the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 was determined to be valid by comparison to the output of the validation of BRAGFLO 4.10, done on an Alpha 2100 running OpenVMS 6.1 (Hanson; Fox; Trone, 2003). In the validation for Test Case #10 for BRAGFLO 4.10, the acceptance criteria were comparisons with analytical solutions of the output from the test case (Schreiber 1997a). The code BF2_TEST10_POST.FOR was run to perform several post-processing functions: 1) It extracts results from the BRAGFLO ASCII output file; 2) it calculates the analytical solution at the same radial distances from the wellbore at which BRAGFLO has output results; 3) it calculates the absolute and relative errors in the BRAGFLO results compared with the analytical results; and 4) it places the results for both BRAGFLO and the analytical solution into a data file, BF2_TEST10.DAT, which is input to the plotting software, SPLAT. The resulting plots superimposed BRAGFLO results and the analytical solutions. Numerical comparisons were also performed.

6.10.3 Input Files

Two types of input files are required to run BRAGFLO 6.0. The first input file, BF2_QB0600_TEST10.INP, is an ASCII control file generated by the PREBRAG software module and is shown in Appendix A.10.2. This file is generated by modifying the input file, BF2_TEST10_QA0500.INP, which was used in the validation of BRAGFLO 5.0, for the new input information for BRAGFLO 6.0. The VMS DIFFERENCE command is used to compare these two files and the differences are recorded in the ASCII file, BF2_QB0600_ES47_TEST10_INP.DIF (Figure 6.10.2). As seen in Figure 6.10.2, the differences between the input files consist of four sections that correspond to the new input information for BRAGFLO 6.0. The first section contains the input of the initial MgO concentration (with the values all set to zero), while the next section shows the input for the material change reset model (with the model disabled by the 0 in the input). The third section contains the input parameters for permeability models 11 and 12 (which are not used in this testcase), as well as for the smooth permeability model (with the model disabled by the 0 in the input). The last section contains the input parameters for the chemistry models, which are all disabled for this testcase.

```

The second input file, BF2_CLOSURE.DAT, contains the closure surface data required by BRAGFLO to define the creep closure surface within the repository. The same input file is used for all 14 test cases. It is too wide to fit the format of a written report, but it is stored in class QB0600 of the CMS library. BF2_CLOSURE.DAT is an ASCII input file that is read by BRAGFLO if creep closure is to be simulated. If creep closure is not to be simulated a dummy file must be included even though this dummy file will not be read. The user is responsible for the creation of a file with porosity surface information. It is not generated by PREBRAG, but a .CSD file is generated by the SANTOS software module, which can be used as the BRAGFLO 6.0 input file.

6.10.4 Test Results

Regression testing is used for Test Case #10 to show that the acceptance criteria for BRAGFLO 6.0 have been satisfied. The ASCII output file, BF2_QB0600_ES47_TEST10.OUT, from Test

Case #10 of BRAGFLO 6.0 run on the ES47 is compared to the output file, BF2_VMS82_V500_ES47_TEST10.OUT (Nemer, 2006), using the VMS DIFFERENCE command. The results are stored in BF2_QB0600_ES47_TEST10_OUT.DIF, which is shown in Appendix A.10.3, with differences due to reporting of new input information indicated in bold italics. A summary of differences is listed in Figure 6.10.3.

FIGURE 6.10.3 Summary of Difference Statistics for Test Case #10

```
Number of difference sections found: 14
Number of difference records found: 196

DIFFERENCES /IGNORE=(SPACING,TRAILING_SPACES,BLANK_LINES)/MERGED=1/OUTPUT=-
    PAA:[ANALYSIS.BF.QB0600.ES47.TEST10]BF2_QB0600_ES47_TEST10_OUT.DIF;1-
    PAA:[ANALYSIS.BF.QB0600.ES47.TEST10]BF2_QB0600_ES47_TEST10.OUT;1-
    PAA:[ANALYSIS.BF.QB0600.ES47.TEST10]BF2_VMS82_V500_ES47_TEST10.OUT;1
```

- Difference in dates and times, file and directory names, code version and date, and execution statistics: 8 sections;
- Differences due to new input: 6 sections.

The ASCII output files, BF2_QB0600_ES40_TEST10.OUT and BF2_QB0600_ES45_TEST10.OUT, from Test Case #10 of BRAGFLO 6.0 run on the ES40 and ES45, respectively, are compared to the output file, BF2_QB0600_ES47_TEST10.OUT, using the VMS DIFFERENCE command, with the results stored in BF2_QB0600_ES40_TEST10_OUT.DIF and BF2_QB0600_ES45_TEST10_OUT.DIF (Appendix A.10.4), respectively. Examinations of these files show that there are no differences other than run dates and times, file and directory names, platform names, and execution statistics.

There are no unacceptable differences in values of output variables for Test Case #10 between BRAGFLO 6.0 and BRAGFLO 5.0 running on the OpenVMS 8.2 operating system. Visual inspection of the ASCII output files confirmed that the input that describes the test case is read correctly. Based on the comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified for Test Case #10 in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.

6.11 Test Case #11. Pressure and Density of Water Column in Equilibrium

6.11.1 Test Objective

The purpose of this test is to verify that the mass balance equations that BRAGFLO solves are implemented correctly by comparing BRAGFLO results with an analytical solution for a problem that considers the pressure and density at the bottom of a column of water in gravity equilibrium. This is a test of Functional Requirement R.15 and R.18.

The mass balance equations that BRAGFLO solves are:

$$\begin{aligned}&\frac{\partial}{\partial x}\left[\frac{\alpha\rho k_x}{\mu}\left(\frac{\partial P}{\partial x}+\rho g\frac{\partial D}{\partial x}\right)\right]+\frac{\partial}{\partial y}\left[\frac{\alpha\rho k_y}{\mu}\left(\frac{\partial P}{\partial y}+\rho g\frac{\partial D}{\partial y}\right)\right]+\\&\frac{\partial}{\partial z}\left[\frac{\alpha\rho k_z}{\mu}\left(\frac{\partial P}{\partial z}+\rho g\frac{\partial D}{\partial z}\right)\right]+\alpha q=\frac{\partial}{\partial t}(\alpha\phi\rho S).\end{aligned} \tag{6.11.1}$$

where

x,y,z	= grid dimension [m],
α	= geometric factor, dependent upon dimensions of problem
ρ	= density [kg/m^3]
k_x, k_y, k_z,	= effective permeability [m^2],
μ	= viscosity [Pa s],
P	= pressure [Pa],
g	= local acceleration of gravity [m/s^2],
D	= elevation [m],
q	= all sources combined [kg/m^3 s],
t	= time [s],
ϕ	= porosity [m^3 void/m^3 rock],
S	= saturation [m^3 phase/m^3 void volume].

The test problem considers a water column 500 m high subdivided into 50 grid blocks, each 10 m thick. The elevation change between the top and bottom grid block centers is 490 m. Water compressibility is 1.0×10^{-8} Pa^{-1}, a value that is larger than actual water compressibility and used in order to magnify the effects of density change for this test problem. Initial pressure is 10 MPa throughout the grid. BRAGFLO is run until gravity equilibrium is obtained (1×10^6 sec). The conditions specified by BRAGFLO at the top of the water column are taken as reference conditions for the analytic solution. The analytic solution at the bottom of the column is then compared to the BRAGFLO solution at the bottom grid block.

6.11.2 Test Procedure

Test Case #11 is run using the WIPP PA run control system. The scripts, script input files, and all other files related to validation testing of BRAGFLO 6.0 reside in QB0600 class of the CMS library, LIBBF. All test inputs are fetched at run time by the scripts, and test outputs/results and run logs are automatically stored by the scripts in the CMS library. The test case is run on each of the three platforms, ES40, ES45 and ES47. Excerpts from the BRAGFLO 6.0, Test Case #11, .LOG files, BF2_QB0600_ES40_TEST11_RUN.LOG, BF2_QB0600_ES45_TEST11_RUN.LOG and BF2_QB0600_ES47_TEST11_RUN.LOG are included in Appendix A.11.1. These indicate the files that are used or generated.

To validate BRAGFLO 6.0 on all three platforms, the following procedure is performed for Test Case #11.

1) Validation test results from BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 5.0 run on the ES47 with OpenVMS 8.2 (Nemer, 2006).
2) Validation test results from BRAGFLO 6.0 run on the ES40 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.
3) Validation test results from BRAGFLO 6.0 run on the ES45 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

The VMS DIFFERENCE command is used to compare the output file from BRAGFLO 6.0 to the corresponding output file as outlined above. Differences are recorded in ASCII files. Differences that involve dates and times, file and directory names, platform names, code version and date, and execution statistics are deemed to be acceptable. In addition, differences, involving the reporting of new input information for BRAGFLO 6.0 in the output files, are acceptable and desirable, because they improve documentation of analyses. Numerical differences, if any, are evaluated according the requirements of the BRAGFLO 6.0 RD/VVP (Nemer, 2007).

The results from the validation test of BRAGFLO 5.0 on the ES47 running OpenVMS 8.2 were determined valid by comparison to the output from the validation of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 (Nemer, 2006). The output of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 was determined to be valid by comparison to the output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 (Stein; Zelinski, 2004b). The output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 was determined valid by comparison to the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 (Fox; Trone, 2003). In turn, the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 was determined to be valid by comparison to the output of the validation of BRAGFLO 4.10, done on an Alpha 2100 running OpenVMS 6.1 (Hanson; Fox; Trone, 2003). In the validation for Test Case #11 for BRAGFLO 4.10, the acceptance criteria were comparisons with analytical solutions of the output from the test case (Schreiber 1997a).

6.11.3 Input Files

Two types of input files are required to run BRAGFLO 6.0. The first input file, BF2_QB0600_TEST11.INP, is an ASCII control file generated by the PREBRAG software module and is shown in Appendix A.11.2. This file is generated by modifying the input file, BF2_TEST11_DENNEW_QA0500.INP, which was used in the validation of BRAGFLO 5.0, for the new input information for BRAGFLO 6.0. The VMS DIFFERENCE command is used to compare these two files and the differences are recorded in the ASCII file, BF2_QB0600_ES47_TEST11_INP.DIF (Figure 6.11.1). As seen in Figure 6.11.1, the differences between the input files consist of four sections that correspond to the new input information for BRAGFLO 6.0. The first section contains the input of the initial MgO concentration (with the values all set to zero), while the next section shows the input for the material change reset model (with the model disabled by the 0 in the input). The third section contains the input parameters for permeability models 11 and 12 (which are not used in this testcase), as well as for the smooth permeability model (with the model disabled by the 0 in the input). The last section contains the input parameters for the chemistry models, which are all disabled for this testcase.

```

- Difference in dates and times, file and directory names, code version and date, and execution statistics: 11 sections;
- Differences due to new input: 6 sections.

The ASCII output files, BF2_QB0600_ES40_TEST11.OUT and BF2_QB0600_ES45_TEST11.OUT, from Test Case #11 of BRAGFLO 6.0 run on the ES40 and ES45, respectively, are compared to the output file, BF2_QB0600_ES47_TEST11.OUT, using the VMS DIFFERENCE command, with the results stored in BF2_QB0600_ES40_TEST11_OUT.DIF and BF2_QB0600_ES45_TEST11_OUT.DIF (Appendix A.11.4), respectively. Examinations of these files show that there are no differences other than run dates and times, file and directory names, platform names, and execution statistics.

There are no unacceptable differences in values of output variables for Test Case #11 between BRAGFLO 6.0 and BRAGFLO 5.0 running on the OpenVMS 8.2 operating system. Visual inspection of the ASCII output files confirmed that the input that describes the test case is read correctly. Based on the comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified for Test Case #11 in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.

6.12 Test Case #12. Direct Brine Release

6.12.1 Test Objective

The purpose of this test is to verify that BRAGFLO 6.0 can read successfully an input file designed to model a direct brine release featuring a single waste region, as was done for the Compliance Certification Application (CCA) using BRAGFLO, Version 4.01. This is a test of Functional Requirement R.2 and R.18.

The test problem is taken from the suite of BRAGFLO DBR runs evaluated for the 1996 CCA analysis using BRAGFLO, Version 4.01 (BF4_BRAGFLO). It consists of two BRAGFLO runs. The first models direct brine releases for a second intrusion at 1200 yr. into the same waste panel that previously experienced an initial intrusion that penetrated both the repository and an underlying brine reservoir in the Castile formation at 1000 yr. The second BRAGFLO run models direct brine releases for a second intrusion at 1200 yr. into a different waste panel than one that previously experienced an initial intrusion that penetrated both the repository and an underlying brine reservoir in the Castile formation at 1000 yr.

6.12.2 Test Procedure

Test Case #12 is run using the WIPP PA run control system. The scripts, script input files, and all other files related to validation testing of BRAGFLO 6.0 reside in QB0600 class of the CMS library, LIBBF. All test inputs are fetched at run time by the scripts, and test outputs/results and run logs are automatically stored by the scripts in the CMS library. The test case is run on each of the three platforms, ES40, ES45 and ES47. Excerpts from the BRAGFLO 6.0, Test Case #12, .LOG files, BF2_QB0600_ES40_TEST12_UPPER_RUN.LOG,
BF2_QB0600_ES40_TEST12_LOWER_RUN.LOG,
BF2_QB0600_ES45_TEST12_UPPER_RUN.LOG,
BF2_QB0600_ES45_TEST12_LOWER_RUN.LOG,
BF2_QB0600_ES47_TEST12_UPPER_RUN.LOG, and
BF2_QB0600_ES47_TEST12_LOWER_RUN.LOG are included in Appendix A.12.1. These indicate the files that are used or generated.

To validate BRAGFLO 6.0 on all three platforms, the following procedure is performed for Test Case #12.

1) Validation test results from BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 5.0 run on the ES47 with OpenVMS 8.2 (Nemer, 2006).
2) Validation test results from BRAGFLO 6.0 run on the ES40 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.
3) Validation test results from BRAGFLO 6.0 run on the ES45 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

The VMS DIFFERENCE command is used to compare the output file from BRAGFLO 6.0 to the corresponding output file as outlined above. Differences are recorded in ASCII files. Differences that involve dates and times, file and directory names, platform names, code version and date, and execution statistics are deemed to be acceptable. In addition, differences, involving the reporting of new input information for BRAGFLO 6.0 in the output files, are acceptable and desirable, because they improve documentation of analyses. Numerical differences, if any, are evaluated according the requirements of the BRAGFLO 6.0 RD/VVP (Nemer, 2007).

The results from the validation test of BRAGFLO 5.0 on the ES47 running OpenVMS 8.2 were determined valid by comparison to the output from the validation of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 (Nemer, 2006). The output of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 was determined to be valid by comparison to the output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 (Stein; Zelinski, 2004b). The output of BRAGFLO 4.10 on the Compaq ES45 running OpenVMS 7.3-1 was determined valid by comparison to the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 (Fox; Trone, 2003). In turn, the output of BRAGFLO 4.10 from the Compaq ES40 running OpenVMS 7.3-1 was determined to be valid by comparison to the output of the validation of BRAGFLO 4.10, done on an Alpha 2100 running OpenVMS 6.1 (Hanson; Fox; Trone, 2003). In the validation for Test Case #12 for BRAGFLO 4.10, the acceptance criteria were manual inspection of the output (Schreiber 1997a).

6.12.3 Input Files

Two types of input files are required to run BRAGFLO 6.0. The first type of input file, BF2_QB0600_TEST12_UPPER.INP and BF2_QB0600_TEST12_LOWER.INP are ASCII control files generated by the PREBRAG software module and are shown in Appendix A.12.2. These files are generated by modifying the input files, BF2_R1_S3_V046_T1200_U_QA0500.INP and BF2_R1_S3_V046_T1200_L_QA0500.INP, which were used in the validation of BRAGFLO 5.0, for the new input information for BRAGFLO 6.0. The VMS DIFFERENCE command is used to compare these files and the differences are recorded in the ASCII files, BF2_QB0600_ES47_TEST12_UPPER_INP.DIF and BF2_QB0600_ES47_TEST12_LOWER_INP.DIF (Figure 6.12.1). As seen in Figure 6.12.1, the differences between the input files consist of five section for BF2_QB0600_ES47_TEST12_UPPER_INP.DIF and six sections for BF2_QB0600_ES47_TEST12_LOWER_INP.DIF. Five sections correspond to the new input information for BRAGFLO 6.0. The first sections of both files contain flags to write the new output variables for BRAGFLO 6.0 to the binary files. The order of the flags changed in BRAGFLO 6.0, but the input file flags are set to output the same variables as before. The second sections of both files contain the input of the initial MgO concentration (with the values all set to zero), while the third sections of both files show the input for the material change reset model (with the model disabled by the 0 in the input). The fourth sections of both files contain the input parameters for permeability models 11 and 12 (which are not used in this testcase), as well as for the smooth permeability model (with the model disabled by the 0 in the input). The fifth section for BF2_QB0600_ES47_TEST12_LOWER_INP.DIF shows the cleanup of two extra 1s that are not used or read. The last sections of both files contain the density input parameters for the chemistry models, which are not used for this testcase.

FIGURE 6.12.1 Input File Differences for Test Case #12, BF2_QB0600_ES47_TEST12_UPPER_INP.DIF and BF2_QB0600_ES47_TEST12_LOWER_INP.DIF

The second input file, BF2_CLOSURE.DAT, contains the closure surface data required by BRAGFLO to define the creep closure surface within the repository. The same input file is used for all 14 test cases. It is too wide to fit the format of a written report, but it is stored in class QB0600 of the CMS library. BF2_CLOSURE.DAT is an ASCII input file that is read by

BRAGFLO if creep closure is to be simulated. If creep closure is not to be simulated a dummy file must be included even though this dummy file will not be read. The user is responsible for the creation of a file with porosity surface information. It is not generated by PREBRAG, but a .CSD file is generated by the SANTOS software module, which can be used as the BRAGFLO 6.0 input file.

6.12.4 Test Results

Regression testing is used for Test Case #12 to show that the acceptance criteria for BRAGFLO 6.0 have been satisfied. The ASCII output files, BF2_QB0600_ES47_TEST12_UPPER.OUT and BF2_QB0600_ES47_TEST12_LOWER.OUT, from Test Case #12 of BRAGFLO 6.0 run on the ES47 are compared to the output files, BF2_VMS82_V500_ES47_R1_S3_V046_T1200_UP.OUT and BF2_VMS82_V500_ES47_R1_S3_V046_T1200_L.OUT (Nemer, 2006), using the VMS DIFFERENCE command. The results are stored in BF2_QB0600_ES47_TEST12_UPPER_OUT.DIF and BF2_QB0600_ES47_TEST12_LOWER_OUT.DIF, with differences due to reporting of new input information indicated in bold italics (Appendix A.12.3). A summary of differences is listed in Figure 6.12.2.

FIGURE 6.12.2 Summary of Difference Statistics for Test Case #12

BF2_QB0600_ES47_TEST12_UPPER_OUT.DIF

```
Number of difference sections found: 14

    PAA:[ANALYSIS.BF.QB0600.ES47.TEST12_UPPER]BF2_QB0600_ES47_TEST12_UPPER.OUT;1-
    PAA:[ANALYSIS.BF.QB0600.ES47.TEST12_UPPER]BF2_VMS82_V500_ES47_R1_S3_V046_T1200_UP.OUT;1
```

- Difference in dates and times, file and directory names platform names, and execution statistics: 10 sections;
- Differences due to new input: 4 sections.

BF2_QB0600_ES47_TEST12_LOWER_OUT.DIF

```
Number of difference sections found: 14
Number of difference records found: 155

DIFFERENCES /IGNORE=(SPACING,TRAILING_SPACES,BLANK_LINES)/MERGED=1/OUTPUT=-
    PAA:[ANALYSIS.BF.QB0600.ES47.TEST12_LOWER]BF2_QB0600_ES47_TEST12_LOWER_OUT.DIF;1-
    PAA:[ANALYSIS.BF.QB0600.ES47.TEST12_LOWER]BF2_QB0600_ES47_TEST12_LOWER.OUT;1-
    PAA:[ANALYSIS.BF.QB0600.ES47.TEST12_LOWER]BF2_VMS82_V500_ES47_R1_S3_V046_T1200_L.OUT;1
```

- Difference in dates and times, file and directory names platform names, and execution statistics: 10 sections;
- Differences due to new input: 4 sections.

The ASCII output files, BF2_QB0600_ES40_TEST12_UPPER.OUT, BF2_QB0600_ES40_TEST12_LOWER.OUT, BF2_QB0600_ES45_TEST12_UPPER.OUT and BF2_QB0600_ES45_TEST12_LOWER.OUT, from Test Case #12 of BRAGFLO 6.0 run on the ES40 and ES45, respectively, are compared to the output files, BF2_QB0600_ES47_TEST12_UPPER.OUT and BF2_QB0600_ES47_TEST12_LOWER.OUT, using the VMS DIFFERENCE command, with the results are stored in BF2_QB0600_ES40_TEST12_UPPER_OUT.DIF, BF2_QB0600_ES40_TEST12_LOWER_OUT.DIF, BF2_QB0600_ES45_TEST12_UPPER_OUT.DIF and BF2_QB0600_ES45_TEST12_LOWER_OUT.DIF (Appendix A.12.4), respectively. Examination of these files show that there are no differences other than run dates and times, file and directory names, platform names, and execution statistics.

There are no unacceptable differences in values of output variables for Test Case #12 between BRAGFLO 6.0 and BRAGFLO 5.0 running on the OpenVMS 8.2 operating system. Visual inspection of the ASCII output files confirmed that the input that describes the test case is read correctly. Based on the comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified for Test Case #12 in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.

6.13 Test Case #13. Error Reporting for Incorrect Number of Waste Material Regions

6.13.1 Test Objective

There must be a separate waste material region for each region of the model that is to contain waste [R.19]. In order to test requirement R.19, the input file for Test Case #6 is altered so that there is only one waste material region for two regions, WAS_AREA and REPOSIT, that will contain waste (WIPP PA 2004). Test Case #13 is run with the incorrect input file, and BRAGFLO should terminate with an error message

6.13.2 Test Procedure

Test Case #13 is run using the WIPP PA run control system. The scripts, script input files, and all other files related to validation testing of BRAGFLO 6.0 reside in QB0600 class of the CMS library, LIBBF. All test inputs are fetched at run time by the scripts, and test outputs/results and run logs are automatically stored by the scripts in the CMS library. The test case is run on each of the three platforms, ES40, ES45 and ES47. Excerpts from the BRAGFLO 6.0, Test Case #13, .LOG files, BF2_QB0600_ES40_TEST13_RUN.LOG, BF2_QB0600_ES45_TEST13_RUN.LOG and BF2_QB0600_ES47_TEST13_RUN.LOG are included in Appendix A.13.1. These indicate the files that are used or generated.

To validate BRAGFLO 6.0 on all three platforms, the following procedure is performed for Test Case #13.

1) Validation test results from BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 5.0 run on the ES47 with OpenVMS 8.2 (Nemer, 2006).
2) Validation test results from BRAGFLO 6.0 run on the ES40 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.
3) Validation test results from BRAGFLO 6.0 run on the ES45 with OpenVMS 8.2 are compared to results from the validation tests of BRAGFLO 6.0 run on the ES47 with OpenVMS 8.2.

The VMS DIFFERENCE command is used to compare the output file from BRAGFLO 6.0 to the corresponding output file as outlined above. Differences are recorded in ASCII files. Differences that involve dates and times, file and directory names, platform names, code version and date, and execution statistics are deemed to be acceptable. In addition, differences, involving the reporting of new input information for BRAGFLO 6.0 in the output files, are acceptable and desirable, because they improve documentation of analyses. Numerical differences, if any, are evaluated according the requirements of the BRAGFLO 6.0 RD/VVP (Nemer, 2007).

The results from the validation test of BRAGFLO 5.0 on the ES47 running OpenVMS 8.2 were determined valid by comparison to the output from the validation of BRAGFLO 5.0 on the ES40 with OpenVMS 7.3-1 (Nemer, 2006). The output of BRAGFLO 5.0 on the ES40 with

OpenVMS 7.3-1 was determined to be valid by manual inspection of the output file (Stein; Zelinski, 2004b).

6.13.3 Input Files

Two types of input files are required to run BRAGFLO 6.0. The first input file, BF2_QB0600_TEST13.INP, is an ASCII control file generated by the PREBRAG software module and is shown in Appendix A.13.2. This file is generated by modifying the input file, BF2_TEST13_QA0500.INP, which was used in the validation of BRAGFLO 5.0, for the new input information for BRAGFLO 6.0. The VMS DIFFERENCE command is used to compare these two files and the differences are recorded in the ASCII file, BF2_QB0600_ES47_TEST13_INP.DIF (Figure 6.13.1). As seen in Figure 6.13.1, the differences between the input files consist of thirteen sections that correspond to the new input information for BRAGFLO 6.0. The first and second sections contain flags to write the new output variables for BRAGFLO 6.0 to the ASCII and binary files. The order of the flags changed in BRAGFLO 6.0, but the input file flags are set to output the same variables as before. The third section contains the input of the initial MgO concentration (with the values all set to zero). Sections 4 to 11 shows changes made for the waste area reset model. This model is improved to enable more materials to be reset, instead of being limited to the waste materials (i.e. the shaft, open drifts, etc.) Material #10 CAVITY_4 had two different reset saturations which necessitated the introduction of a new material labeled #39 CAVITY_5 to represent both saturations. Material #39 is given the same properties as #10 (which it replaced in three cells), except for the reset saturation. Section 4 shows the replacement of material #10 with #39. Sections 5, 9, 10 and 11 show the added properties for material #39. Sections 6, 7, and 8 show the reset parameters added for the model change. The values are set to give the same conditions as are given before for the testcase. Section 8 also shows the input for the material change reset model (with the model disabled by the 0 in the input). Section 11 also contains the input parameters for permeability models 11 and 12 (which are not used in this testcase), as well as for the smooth permeability model (with the model disabled by the 0 in the input). Section 12 contains the input parameters for the chemistry models, which are set to the previous testcase values, except for RKCOR and RKBIO, which are divided by the initial concentration of Fe and cellulose, respectively, to test the intrinsic rate flag. The last section contains the inputs for the closure model, which contains the same values as before, but in a different input structure.

FIGURE 6.13.1 Input File Differences for Test Case #13, BF2_QB0600_ES47_TEST13_INP.DIF

The second input file, BF2_CLOSURE.DAT, contains the closure surface data required by BRAGFLO to define the creep closure surface within the repository. The same input file is used for all 14 test cases. It is too wide to fit the format of a written report, but it is stored in class QB0600 of the CMS library. BF2_CLOSURE.DAT is an ASCII input file that is read by BRAGFLO if creep closure is to be simulated. If creep closure is not to be simulated a dummy file must be included even though this dummy file will not be read. The user is responsible for the creation of a file with porosity surface information. It is not generated by PREBRAG, but a .CSD file is generated by the SANTOS software module, which can be used as the BRAGFLO 6.0 input file.

6.13.4 Test Results

Regression testing is used for Test Case #13 to show that the acceptance criteria for BRAGFLO 6.0 have been satisfied. The ASCII output file, BF2_QB0600_ES47_TEST13.OUT, from Test Case #13 of BRAGFLO 6.0 run on the ES47 is compared to the output file, BF2_VMS82_V500_ES47_TEST13.OUT (Nemer, 2006), using the VMS DIFFERENCE command. The results are stored in BF2_QB0600_ES47_TEST13_OUT.DIF, which is shown in Appendix A.13.3, with differences due to reporting of new input information indicated in bold italics. A summary of differences is listed in Figure 6.13.2.

FIGURE 6.13.2 Summary of Difference Statistics for Test Case #13

- Difference in dates and times, file and directory names, code version and date, and execution statistics: 7 sections;
- Differences due to new input: 3 sections.

The ASCII output files, BF2_QB0600_ES40_TEST13.OUT and BF2_QB0600_ES45_TEST13.OUT, from Test Case #13 of BRAGFLO 6.0 run on the ES40 and ES45, respectively, are compared to the output file, BF2_QB0600_ES47_TEST13.OUT, using the VMS DIFFERENCE command, with the results stored in BF2_QB0600_ES40_TEST13_OUT.DIF and BF2_QB0600_ES45_TEST13_OUT.DIF (Appendix A.13.4), respectively. Examinations of these files show that there are no differences other than run dates and times, file and directory names, platform names, and execution statistics.

There are no differences in values of output variables for Test Case #13 between BRAGFLO 6.0 and BRAGFLO 5.0 running on the OpenVMS 8.2 operating system. Visual inspection of the ASCII output files confirmed that the input that describes the test case is read correctly. Based on the comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified for Test Case #13 in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.

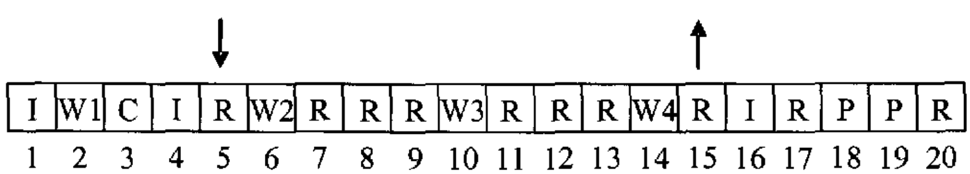
6.14 Test Case #14. Additional Iron and MgO Chemistry

6.14.1 Test Objective

The purpose of this test is to exercise the new functional requirements introduced for BRAGFLO 6.0 for the new chemistry model (R.20-R.23), as well as the model to smoothly change the permeability of materials as a function of time (R.24). Furthermore, this test case assesses the previous requirements with new additions, such as, the MgO initial concentration setup (R.5), the reset capability of during a material change (R.7) and the additional relative permeability and capillary pressure models (R.8). Moreover, this test case tests the basic Functional Requirements R.1 to R.3, R.6, R.11 to R.17, R.26 and R.27, although these requirements are not explicitly examined.

The 1-D test case is discretized into 20 distinct 1 meter sections (Figure 6.14.1). Four separate waste areas are designated, each with varying Iron/Cellulosics/MgO concentrations (R.5) as seen in Table 6.14.1. The Waste area #1 is effectively separated from the other waste areas by a section of material with a very low permeability (10^{-35} m^2). Waste area #1 (section 2) is initialized with Iron, Cellulosics and MgO, with zero saturation. The saturation increases due to flow from the adjacent section and as closure occurs. The chemistry rates in this area should be zero until the saturation cutoff is reached (R.21). Waste area #2 (section 6) is initialized with only MgO to employ only the MgO hydration reaction. Waste area #3 (section 10) is initialized with Cellulosics and MgO to utilize the MgO hydration and carbonation reactions. Waste area #4 (section 14) is initialized with Iron and Cellulosics to exercise the Iron sulfidation reactions. The chemistry rates in each waste area are proportional to the initial concentration (R.22), with the volume of solids produced, calculated in each waste area (R.23). At 8,000 years, the chemical species of Waste area #1 will be reset to zero (R.7).

To facilitate brine to the reactions for waste areas 2 through 4, wells are used to introduce brine and regulate the pressure. As seen represented by the arrows in Figure 6.14.1, on the left side of the waste areas there is a well that injects 10^{-16} kg/s of brine, while on the right side, there is a well with a productivity index of 10^{-6} m^3. This effectively keeps the pressure constant and the saturation high for waste areas 2 through 4.



C = Cavity R = Rock

I = Impermeable W# = Waste #

P = Changes Permeability → = Well Flow

FIGURE 6.14.1 Representation of Grid Used for Test Case #14.

TABLE 6.14.1 Initial Chemical Concentrations (kg/m³) for Waste Areas in Test Case #14.

Waste #	Iron	Cellulosics	MgO
1	100	50	100
2	0	0	110
3	0	45	90
4	110	55	0

Sections 18 and 19 contain material that will smoothly change permeability from 1,000 to 2,000 years and then back to the original permeability from 8,000 to 9,000 years (R.24). The pressure and saturation of Sections 18 and 19 will also be changed at 3,000 years (R.7).

Section 3 simulates an open cavity and is used to exercise a new relative permeability and capillary pressure model, while the new model for the waste area will also be used (R.8).

6.14.2 Test Procedure

Test Case #14 is run using the WIPP PA run control system. The scripts, script input files, and all other files related to validation testing of BRAGFLO 6.0 reside in QB0600 class of the CMS library, LIBBF. All test inputs are fetched at run time by the scripts, and test outputs/results and run logs are automatically stored by the scripts in the CMS library. The test case is run on each of the three platforms, ES40, ES45 and ES47. Excerpts from the BRAGFLO 6.0, Test Case #14, .LOG files, BF2_QB0600_ES40_TEST14_RUN.LOG, BF2_QB0600_ES45_TEST14_RUN.LOG and BF2_QB0600_ES47_TEST14_RUN.LOG are included in Appendix A.14.1. These indicate the files that are used or generated.

Unlike, Test Cases 1-13, regression analysis is not used for the validation of Test Case #14 of BRAGFLO 6.0 on the ES47. This is a new test case designed for the new functional requirements introduced for BRAGFLO 6.0. The validation analyses described in the RD/VVP for Test Case #14 are conducted. Then, the results on the ES40 and ES45 are regression tested against the results on the ES47.

To validate BRAGFLO 6.0 on the ES47, relevant information is extracted from the BRAGFLO ASCII output file, BF2_QB0600_ES47_TEST14.OUT and compared to input file values or results of independent calculations using an Excel spreadsheet. Some values are also obtained from the BRAGFLO 6.0 binary output file, BF2_QB0600_ES47_TEST14.BIN. The software module, POSTBRAG, is used to convert BF2_QB0600_ES47_TEST14.BIN into the file, BF2_QB0600_ES47_TEST14.CDB, which can be read by the software, GROPECDB and BLOTCDB. GROPECDB is used to extract specific values for comparison to results listed in the ASCII output file. BLOTCDB is used to generate plots for comparison, in order to show the entire time history of the variables. The comparison results must agree to three significant figures or to the number of significant figures reported in the output, which ever is less.

6.14.3 Input Files

Two types of input files are required to run BRAGFLO 6.0. The first input file, BF2_QB0600_TEST14.INP, is an ASCII control file generated by the PREBRAG software module and is shown in Appendix A.14.2. This file is generated for the validation testing of Test Case #14.

The second input file, BF2_CLOSURE.DAT, contains the closure surface data required by BRAGFLO to define the creep closure surface within the repository. The same input file is used for all 14 test cases. It is too wide to fit the format of a written report, but it is stored in class QB0600 of the CMS library. BF2_CLOSURE.DAT is an ASCII input file that is read by BRAGFLO if creep closure is to be simulated. If creep closure is not to be simulated a dummy file must be included even though this dummy file will not be read. The user is responsible for the creation of a file with porosity surface information. It is not generated by PREBRAG, but a .CSD file is generated by the SANTOS software module, which can be used as the BRAGFLO 6.0 input file.

6.14.4 Test Results

The acceptance criteria for Test Case #14 are independent calculations and manual inspection of the output to verify that BRAGFLO is performing the calculations correctly. The independent calculations using values of pressures and saturations reported in output files. The results from BRAGFLO and independent calculations agreed to three significant figures (unless fewer digits are provided in the relevant BRAGFLO output or input file) which satisfied the validation criteria of the RD/VVP.

The independent calculations are performed using an Excel spreadsheet, which is stored in class QB0600 of the CMS library and is shown in Appendix A.14.3.

The independent calculations are done using values of pressures and saturations reported in output files. Both Excel and BRAGFLO calculations are done in double precision (15 digits). Thus round off error is not a significant issue between the methods of calculation. However, differences in the format of ASCII output data resulted in small differences with the independent calculations. The spreadsheet also contains comparisons of the independent calculations to corresponding output results from the output files, BF2_QB0600_ES47_TEST14.OUT and BF2_QB0600_ES47_TEST14.CDB. References to locations within the spreadsheet are included in the following description of testing results within brackets (i.e.{ nnn }).

Visual inspection of the ASCII output and independent calculations show that BRAGFLO 6.0 is valid on the ES47 running OpenVMS 8.2. There are no differences in values of output variables for Test Case #14 between the output from the ES40 and ES45 compared with the ES47. Based on the independent calculations and comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified for Test Case #14 in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.

6.14.4.1 Initial MgO Concentration

The initial MgO concentration is tested in the four waste blocks by a manual inspection of the .OUT file and comparison with the values in the input file. Table 6.14.1 shows the initial chemical concentrations for the waste areas specified in the input file for Test Case #14.

The following parameter values reported in the output file are compared with input file values and are found to be in agreement to the number of digits reported.

C^0_{MgO} (Waste 1)	= 1.0E+02 kg MgO m^{-3}	{line 4}
C^0_{MgO} (Waste 2)	= 1.1E+02 kg MgO m^{-3}	{line 5}
C^0_{MgO} (Waste 3)	= 9.0E+01 kg MgO m^{-3}	{line 6}
C^0_{MgO} (Waste 4)	= 0.0E+00 kg MgO m^{-3}	{line 7}

This verifies the new addition to Functional Requirement R.5 for BRAGFLO 6.0.

6.14.4.2 Material Change Reset Model

The material change reset model is tested by manual inspection of the .OUT file, comparison with the values in the input file and by plotting results from the .CDB file using BLOTCDB.

The following parameter values reported in the output file are compared with input file values and are found to be in agreement to the number of digits reported.

Intrustion Time 1	= 9.46730E+10 s	{line 9}
Material 1	= 3	{line 10}
Reset Pressure 1	= 6.00000E+05 s	{line 11}
Reset Saturation 1	= 5.00000E-01 s	{line 12}
Chemistry Reset Flag 1	= F	{line 13}
Intrustion Time 2	= 9.46730E+10 s	{line 14}
Material 2	= 7	{line 15}
Reset Pressure 2	= Pressure is not reset	{line 16}
Reset Saturation 2	= Brine Satn is not reset	{line 17}
Chemistry Reset Flag 2	= F	{line 18}
Intrustion Time 3	= 2.52460E+11 s	{line 19}
Material 3	= 8	{line 20}

Reset Pressure 3	= Pressure is not reset	{line 21}
Reset Saturation 3	= Brine Satn is not reset	{line 22}
Chemistry Reset Flag 3	= T	{line 23}

The material change reset model is validated with elements 6, 7 and 18 as these contain materials 8, 7 and 3, respectively, since these are the materials specified by the input file. The elements 6, 7 and 18 correspond to grid cells (2,1,1), (6,1,1) and (18,1,1), respectively.

In Test Case #14 the pressure for material 3 (element 18) is set to change to 6.0E+05 at 3,000 years (9.4673E+10 s), while the pressure for material 8 (element 6) should not be reset. The pressure history for elements 6 and 18 is shown below in Figure 6.14.2. As seen in Figure 6.14.2, there is a step change in pressure to 6.0E+05 for element 18 at 3,000 years, while no step change is present for element 6.

In Test Case #14 the brine saturation for material 3 (element 18) is set to change to 5.0E-01 at 3,000 years (9.4673E+10 s), while the brine saturation for material 8 (element 6) should not be reset. The brine saturation history for elements 6 and 18 is shown below in Figure 6.14.3. As seen in Figure 6.14.3, there is a step change in the brine saturation to 5.0E-01 for element 18 at 3,000 years, while no step change is present for element 6.

In Test Case #14, the species concentrations for material 8 (element 6) is set to change to 0 at 8,000 years (2.5246E+11 s), while the species concentrations for material 7 (element 7) should not be reset. The MgO concentration for element 6 and the $Mg(OH)_2$ concentration for element 7 are shown below in Figure 6.14.4. As seen in Figure 6.14.4, there is a step change in the MgO concentration to 0 for element 6 at 8,000 years, while no step change in the $Mg(OH)_2$ concentration is present for element 7.

This verifies the new addition to Functional Requirement R.7 for BRAGFLO 6.0.

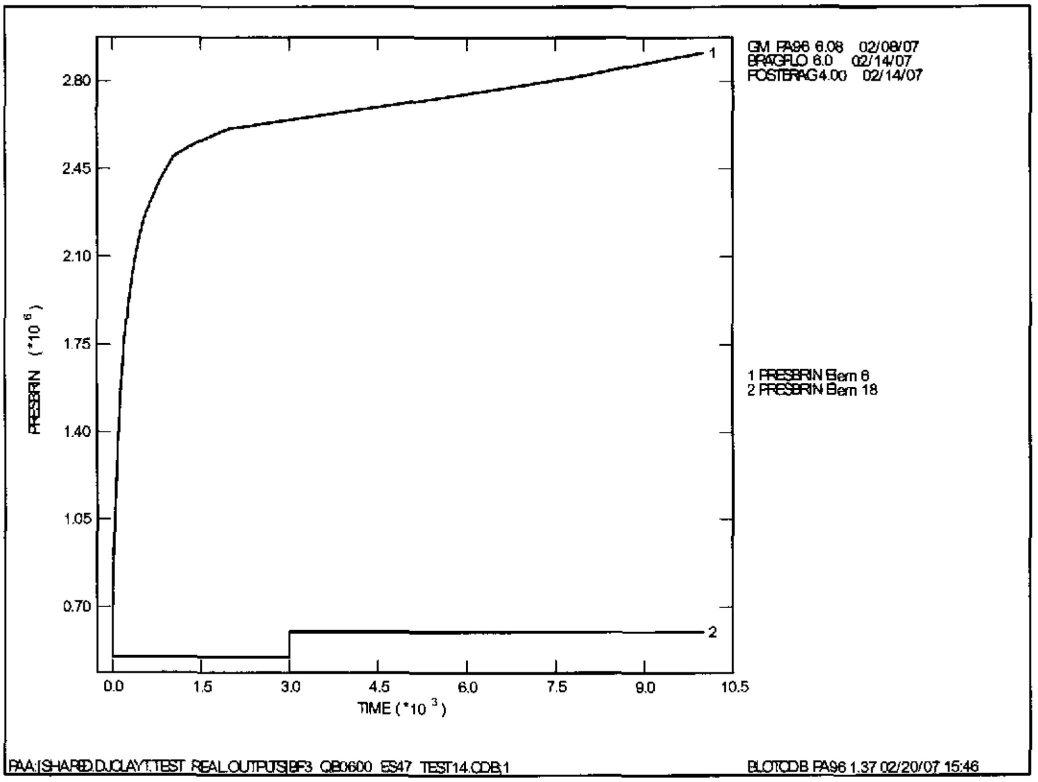


FIGURE 6.14.2 Pressure history for elements 6 and 18.

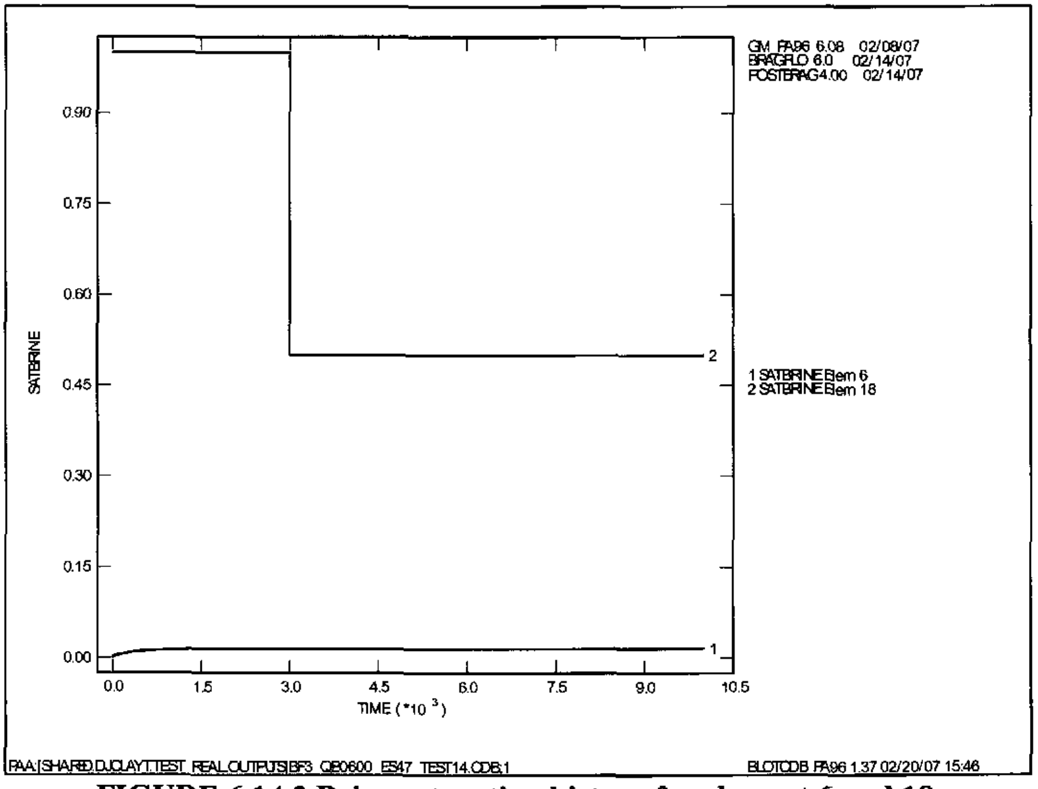

FIGURE 6.14.3 Brine saturation history for element 6 and 18.

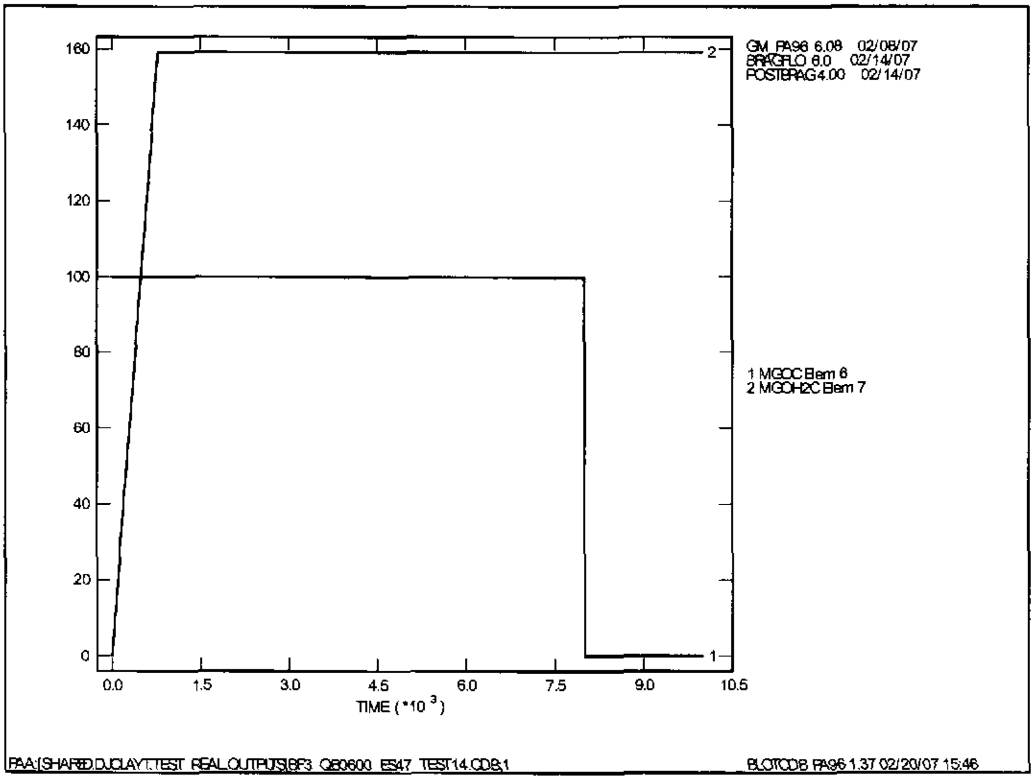

FIGURE 6.14.4 MgO concentration history for element 6 with $Mg(OH)_2$ concentration history for element 7.

6.14.4.3 Relative Permeability and Capillary Pressure Model

Test Case #14 tests the two new relative permeability and capillary pressure models: an open cavity model (KRP=11), and a modification of the KRP=4 model in which the saturation cutoff is accounted for and the residual brine saturation is modified for the capillary pressure model (KRP=12). Both of these models are explicit functions of saturation and are easily verified.

The open cavity model (KRP = 11) provides relative permeabilities and capillary pressures from the following:

$$k_{rw} = \begin{cases} 0 & S_w \le S_{wr} \\ (S_w - S_{wr})/TOL & S_{wr} < S_w \le S_{wr} + TOL \\ 1 & S_{wr} + TOL < S_w \end{cases} \tag{6.14.1}$$

$$k_{rg} = \begin{cases} 0 & 1 - S_w \le S_{gr} \\ (1 - S_w - S_{gr})/TOL & S_{gr} < 1 - S_w \le S_{gr} + TOL \\ 1 & S_{gr} + TOL < 1 - S_w \end{cases} \tag{6.14.2}$$

$$P_c = 0 \tag{6.14.3}$$

The residual brine saturation, S_{wr} = SBR, residual gas saturation, S_{gr} = SGR, and the tolerance, TOL = TOL are input parameters.

The gas pressure is obtained from the brine pressure, P_b, and the capillary pressure, P_c:

$$P_g = P_b + P_c. \tag{6.14.4}$$

The open cavity model (KRP = 11) is tested at t = 999 and 3.1557E+09 s in element 10 (grid block (3,1,1)), where the brine saturations and brine pressures are given in the BRAGFLO output file as follows:

S_w(999 s)	= 9.04027E-04	{line 25}
P_o(999 s)	= 5.17104E+05	{line 26}
S_w(3.1557E+09 s)	= 0.00000E+00	{line 27}
P_o(3.1557E+09 s)	= 1.42576E+06	{line 28}

The following parameters are read from the input file and echoed to the output file:

S_{wr}	= residual brine saturation	= 0.00E+00	{line 29}
S_{gr}	= residual gas saturation	= 0.00E+00	{line 30}
TOL	= tolerance	= 1.0000E-02	{line 31}

Calculating the wetting phase (brine) relative permeability from Equation 6.14.1 gives

k_{rw}(999 s)	= 9.04027E-02	{cell E32}
k_{rw}(3.1557E+09 s)	= 0.00000E+00	{cell E33}

This independent calculation of the brine phase relative permeabilities agrees with the values obtained from the file, BF3_QA0500_TEST6.CDB, {cell D32} (9.04027E-02) and the BRAGFLO output file {cell D33} (0.00000E+00).

Calculating the gas phase relative permeability from Equation 6.14.2 gives

k_{rg}(999 s)	= 1.00000E+00	{cell E34}
k_{rg}(3.1557E+09 s)	= 1.00000E+00	{cell E35}

This independent calculation of the gas phase relative permeabilities agrees with the values obtained from the file, BF3_QA0500_TEST6.CDB, {cell D34} (1.00000E+00) and the BRAGFLO output file {cell D35}(1.00000E+00).

Calculating the gas pressure from Equations 6.14.3 and 6.14.4 gives

P_g(999 s)	= 5.17104E+05	{cell E38}
P_g(3.1557E+09 s)	= 1.42576E+06	{cell E39}

This independent calculation of the gas pressure agrees with the values obtained from the file, BF3_QA0500_TEST6.CDB, {cell D38} (5.17104E+05) and the BRAGFLO output file {cell D39} (1.42576E+06).

The modification of the KRP = 4 model (KRP=12) gives relative permeabilities and capillary pressures from

$$k_{rw} = S_e^{(2+3\lambda)/\lambda} \tag{6.14.5}$$

$$k_{rg} = \left(1 - S_{eg}\right)^2 \left(1 - S_{eg}^{(2+\lambda)/\lambda}\right) \tag{6.14.6}$$

$$P_c = \frac{P_t}{S_{me}^{1/\lambda}}, \tag{6.14.7}$$

where the modified brine saturation is

$$S_e = \frac{S_w - S_{wr}}{1 - S_{wr}} \tag{6.14.8}$$

the modified gas saturation is

$$S_{eg} = \frac{S_w - S_{wr}}{1 - S_{gr} - S_{wr}} \tag{6.14.9}$$

and the modified effective brine saturation is

$$S_{me} = \frac{S_w - \left(S_{co} - S_{e\min}\right)}{1 - \left(S_{co} - S_{e\min}\right)}. \tag{6.14.10}$$

The parameters λ, S_{co} and S_{emin} are the input parameters XLAMDA, SOCMIN and SOCEFFMIN.

The P_t = threshold capillary pressure, which is correlated to permeability is calculated by:

$$P_t = ak^{\eta}, \tag{6.14.11}$$

The parameters in this correlation are input as a = PCT_A and η = PCT_EXP.

The KRP = 12 model is tested at t = 3.1557E+09 s in element 6 (grid block (2,1,1)), where the brine saturation, brine pressure and x-permeability are given in the BRAGFLO output file as follows:

S_w	= 4.86647E-03	{line 40}
P_o	= 1.37260E+06	{line 41}
k	= 5.27757E-13	{line 42}

The following parameters are read from the input file and echoed to the output file:

λ	= pore distribution parameter	= 2.89E+00	{line 43}
S_{wr}	= residual brine saturation	= 0.00E+00	{line 44}
S_{gr}	= residual gas saturation	= 0.00E+00	{line 45}
S_{co}	= cutoff brine saturation	= 1.50E-02	{line 46}
S_{emin}	= effective minimum brine saturation	= 1.00E-03	{line 47}
a	= threshold pressure constant	= 2.60E-01	{line 48}
η	= threshold pressure exponent	= -3.48E-01	{line 49}

Calculating the wetting phase (brine) relative permeability from Equations 6.14.5 and 6.14.8 gives

k_{rw}(3.1557E+09 s) = 2.89133E-09 {cell E51}

This independent calculation of the brine phase relative permeability agrees with the values obtained from the BRAGFLO output file {cell D51} (2.89134E-09).

Calculating the gas phase relative permeability from Equations 6.14.6 and 6.14.9 gives

k_{rg}(3.1557E+09 s) = 9.90170E-01 {cell E53}

This independent calculation of the gas phase relative permeability agrees with the values obtained from the BRAGFLO output file {cell D53} (9.90170E-01).

Calculating the gas pressure from Equations 6.14.4, 6.14.7 and 6.14.11 gives

P_g(3.1557E+09 s) = 1.42577E+06 {cell E57}

This independent calculation of the gas pressure agrees with the values obtained from the BRAGFLO output file {cell D57} (1.42576E+06).

The agreement between these calculations and the BRAGFLO output verifies that the two relative permeability models, KRP = 11 and KRP = 12, are being treated correctly in BRAGFLO, and verifies Functional Requirements R.8.

6.14.4.4 Saturation Dependent Chemistry Rates

For Test Case #14, the iron corrosion rate, cellulosics (CH_2O) microbial degradation rate and MgO hydration rate, q_{rc}, q_{rm} and q_{rh} (mol s^{-1}), are functions of the saturation and are proportional to the initial concentration of Fe, CH_2O, and MgO in each cell, C^0_{Fe}, C^0_{CH2O} and C^0_{MgO} (kg m^{-3}), respectively,

$$\begin{aligned} q_{rc} &= \left(r_{ci}S_{cw} + r_{ch}S_{ncw}\right)C^0_{\mathrm{Fe}}V \\ q_{rm} &= \left(r_{mi}S_{cw} + r_{mh}S_{ncw}\right)C^0_{\mathrm{CH2O}}V \\ q_{rh} &= \left(r_{hi}S_{cw} + r_{hh}S_{ncw}\right)C^0_{\mathrm{MgO}}V \end{aligned} \tag{6.14.12}$$

where

- r_{ci} is the intrinsic inundated iron corrosion rate (mol kg^{-1} s^{-1}),
- r_{ch} is the intrinsic humid iron corrosion rate (mol kg^{-1} s^{-1}),
- r_{mi} is the intrinsic inundated cellulosics microbial degradation rate (mol kg^{-1} s^{-1}),
- r_{mh} is the intrinsic humid cellulosics microbial degradation rate (mol kg^{-1} s^{-1}),
- r_{hi} is the intrinsic inundated MgO hydration rate (mol kg^{-1} s^{-1}),
- r_{hh} is the intrinsic humid MgO hydration rate (mol kg^{-1} s^{-1}),
- S_{cw} is the effective chemistry brine or wetting-phase saturation,
- S_{ncw} is the effective chemistry gas or non-wetting-phase saturation ($S_{ncw} = 1 - S_{cw}$),
- V is the volume of the grid cell (m^3).

In Test Case #14, the humid rates are set to zero, so equation 6.14.12 for the inundated condition reduces to

$$\begin{aligned} q_{rci} &= r_{ci}S_{cw}C^0_{\mathrm{Fe}}V \\ q_{rmi} &= r_{mi}S_{cw}C^0_{\mathrm{CH2O}}V \\ q_{rhi} &= r_{hi}S_{cw}C^0_{\mathrm{MgO}}V \end{aligned} \tag{6.14.13}$$

where

- q_{rci} is the iron corrosion rate under inundated conditions (mol Fe s^{-1}),
- q_{rmi} is the cellulosics microbial degradation rate under inundated conditions (mol CH_2O s^{-1}),
- q_{rhi} is the MgO hydration rate under inundated conditions (mol MgO s^{-1}).

The effective chemistry brine or wetting-phase saturation is calculated by taking the brine saturation in the cell, subtracting the cutoff saturation value and adding the smoothed wicking term

$$S_{cw} = S_w - S_{co} + W\left\{1 - \exp\left[-200\alpha\left(S_w - S_{co}\right)^2\right]\right\} \quad (6.14.14)$$

where

S_{co} is the brine or wetting-phase saturation cutoff value,
W is the wicking saturation,
α is the smoothing exponent.

The effective chemistry brine saturation is bounded to have a minimum value of 0.0 and a maximum value of 1.0, regardless of cutoff value and wicking saturation, while the term $S_w - S_{co}$ has a minimum value of 0.0.

The saturation dependent chemistry rates are tested at t = 3.1557E+09 s for elements 6, 7, 8 and 9 (grid blocks (2,1,1), (6,1,1), (10,1,1) and (14,1,1)), where the brine saturations, grid volumes and initial concentrations of Fe, CH_2O, and MgO are given in the BRAGFLO output file as follows:

S_w(Waste 1 @ 3.1557E+09 s)	= 4.86647E-03	{line 59}
S_w(Waste 2 @ 3.1557E+09 s)	= 8.26608E-01	{line 60}
S_w(Waste 3 @ 3.1557E+09 s)	= 9.78357E-01	{line 61}
S_w(Waste 4 @ 3.1557E+09 s)	= 9.92682E-01	{line 62}
V(Waste 1)	= 1.00000E+00 m^3	{line 64}
V(Waste 2)	= 1.00000E+00 m^3	{line 65}
V(Waste 3)	= 1.00000E+00 m^3	{line 66}
V(Waste 4)	= 1.00000E+00 m^3	{line 67}
C^0_{Fe} (Waste 1)	= 1.00000E+02 mol Fe m^{-3}	{line 68}
C^0_{Fe} (Waste 2)	= 0.00000E+00 mol Fe m^{-3}	{line 69}
C^0_{Fe} (Waste 3)	= 0.00000E+00 mol Fe m^{-3}	{line 70}
C^0_{Fe} (Waste 4)	= 1.10000E+02 mol Fe m^{-3}	{line 71}
C^0_{CH2O} (Waste 1)	= 5.00000E+01 mol CH_2O m^{-3}	{line 72}
C^0_{CH2O} (Waste 2)	= 0.00000E+00 mol CH_2O m^{-3}	{line 73}
C^0_{CH2O} (Waste 3)	= 4.50000E+01 mol CH_2O m^{-3}	{line 74}
C^0_{CH2O} (Waste 4)	= 5.50000E+01 mol CH_2O m^{-3}	{line 75}
C^0_{MgO} (Waste 1)	= 1.00000E+02 mol MgO m^{-3}	{line 76}

C^0_{MgO} (Waste 2)	= 1.10000E+02 mol MgO m^{-3}	{line 77}
C^0_{MgO} (Waste 3)	= 9.00000E+01 mol MgO m^{-3}	{line 78}
C^0_{MgO} (Waste 4)	= 0.00000E+00 mol MgO m^{-3}	{line 79}

The following parameters are read from the input file and echoed to the output file:

r_{ci}	= intrinsic inundated iron corrosion rate	= 3.00E-10 mol kg^{-1} s^{-1}	{line 80}
r_{mi}	= intrinsic inundated microbial degradation rate	= 2.00E-10 mol $kg^{-1}s^{-1}$	{line 81}
r_{ch}/r_{ci}	= ratio of humid to inundated iron corrosion rate	= 0.00E+00	{line 82}
r_{mh}/r_{mi}	= ratio of humid to inundated microbial degradation rate	= 0.00E+00	{line 83}
r_{hi}	= intrinsic inundated MgO hydration rate	= 1.00E-09 mol $kg^{-1}s^{-1}$	{line 84}
r_{hh}	= intrinsic humid MgO hydration rate	= 0.00E+00 mol $kg^{-1}s^{-1}$	{line 85}
S_{co}	= cutoff brine saturation	= 1.50E-02	{line 86}
W	= wicking saturation	= 1.00E+00	{line 87}
α	= smoothing exponent	= 1.00E+03	{line 88}

Calculating the effective chemistry brine saturations from Equations 6.14.14 and using these values in Equation 6.14.13 gives

q_{rci}(Waste 1 @ 3.1557E+09 s)	= 0.0000E+00 mol Fe s^{-1}	{cell E94}
q_{rci}(Waste 2 @ 3.1557E+09 s)	= 0.0000E+00 mol Fe s^{-1}	{cell E95}
q_{rci}(Waste 3 @ 3.1557E+09 s)	= 0.0000E+00 mol Fe s^{-1}	{cell E96}
q_{rci}(Waste 4 @ 3.1557E+09 s)	= 3.3000E-08 mol Fe s^{-1}	{cell E97}
q_{rmi}(Waste 1 @ 3.1557E+09 s)	= 0.0000E+00 mol CH_2O s^{-1}	{cell E99}
q_{rmi}(Waste 2 @ 3.1557E+09 s)	= 0.0000E+00 mol CH_2O s^{-1}	{cell E100}
q_{rmi}(Waste 3 @ 3.1557E+09 s)	= 9.0000E-09 mol CH_2O s^{-1}	{cell E101}
q_{rmi}(Waste 4 @ 3.1557E+09 s)	= 1.1000E-08 mol CH_2O s^{-1}	{cell E102}
q_{rhi}(Waste 1 @ 3.1557E+09 s)	= 0.0000E+00 mol MgO s^{-1}	{cell E104}
q_{rhi}(Waste 2 @ 3.1557E+09 s)	= 1.1000E-07 mol MgO s^{-1}	{cell E105}

q_{rhi}(Waste 3 @ 3.1557E+09 s)	= 9.0000E-08 mol MgO s^{-1}	{cell E106}
q_{rhi}(Waste 4 @ 3.1557E+09 s)	= 0.0000E+00 mol MgO s^{-1}	{cell E107}

This independent calculations of the saturation dependent chemistry rates agree within three to four significant digits with the values obtained from the BRAGFLO output file {cells D94-D97, D99-D102 and D104-D107} (0.00000E+00, 0.00000E+00, 0.00000E+00, 3.30000E-08, 0.00000E+00, 0.00000E+00, 9.00000E-09, 1.10000E-08, 0.00000E+00, 1.10000E-07, 9.00000E-08, 0.00000E+00).

As seen in the output file and independent calculations, the saturation dependent chemistry rates for element 6 are zero at 3.1557E+09 s, since the saturation in the cell is below the cutoff value (4.86646E-03 < 1.50000E-02). Furthermore, the iron corrosion rates for elements 7 and 8, the microbial degradation rate for element 7 and the MgO hydration rate for element 9 are all zero, since these areas are given a zero initial concentration. The saturation of element 6 remains below the cutoff value until 7.64216E+10 s. Using the saturation for element 6 (grid block (2,1,1)) at a later time (t = 9.4673E+10 s) for element 6 as follows

S_w(Waste 1 @ 9.4673E+10 s)	= 1.50339E-02	{line 63}

and calculating the effective chemistry brine saturation from Equations 6.14.14 and using the value in Equation 6.14.13 gives

q_{rci}(Waste 1 @ 9.4673E+10 s)	= 7.9115E-12 mol Fe s^{-1}	{cell E98}
q_{rmi}(Waste 1 @ 9.4673E+10 s)	= 2.6372E-12 mol CH_2O s^{-1}	{cell E103}
q_{rhi}(Waste 1 @ 9.4673E+10 s)	= 2.6372E-11 mol MgO s^{-1}	{cell E108}

This independent calculation of the saturation dependent chemistry rates agrees within three to four significant digits with the values obtained from the BRAGFLO output file {cells D98, D103 and D108} (7.91196E-12, 2.63732E-12, 2.63732E-11).

The agreement between these calculations and the BRAGFLO output verifies that the saturation dependent chemistry rates are being treated correctly in BRAGFLO, and verifies Functional Requirements R.20, R.21, and R.22.

6.14.4.5 Cellulosics Microbial Degradation Dependent Chemistry Rates

The sulfidation and carbonation rates are proportional to the cellulosics microbial degradation rate, q_{rm}.

$$
\begin{aligned}
q_{rsulf} &= s_{sulf} q_{rm} \\
q_{rcarb} &= s_{carb} q_{rm}
\end{aligned}
\tag{6.14.15}
$$

where

q_{rsulf} = the sulfidation rate (mol H_2S s^{-1}),
q_{rcarb} = the carbonation rate (mol CO_2 s^{-1}),
s_{sulf} = the stoichiometric coefficient for H_2S in the cellulosics microbial degradation reaction (mol H_2S/mol CH_2O),
s_{carb} = the stoichiometric coefficient for CO_2 in the cellulosics microbial degradation reaction (mol CO_2/mol CH_2O).

The sulfidation and carbonation is assumed to preferentially react with the $Fe(OH)_2$ and $Mg(OH)_2$ before the Fe and MgO, respectively. The sulfidation and carbonation reactions of Fe and MgO, are added for the case when the cellulosics microbial degradation rate is much faster than the iron corrosion and MgO hydration reactions, respectively. The transition from $Fe(OH)_2$ and $Mg(OH)_2$ to Fe and MgO reacting is smoothed by the following equations, based on the ratio of current $Fe(OH)_2$ and $Mg(OH)_2$ concentrations, C_{FeOH2} and C_{MgOH2}, respectively and the initial concentrations.

$$
\begin{aligned}
q_{rsulf\_FeOH2} &= q_{rsulf}\left[1-\exp\left(-\alpha\frac{\mathrm{C_{FeOH2}}}{\mathrm{C^0_{Fe}}}\right)\right] \\
q_{rsulf\_Fe} &= q_{rsulf} - q_{rsulf\_FeOH2} \\
q_{rcarb\_MgOH2} &= q_{rcarb}\left[1-\exp\left(-\alpha\frac{\mathrm{C_{MgOH2}}}{\mathrm{C^0_{MgO}}}\right)\right] \\
q_{rcarb\_MgO} &= q_{rcarb} - q_{rcarb\_MgOH2}
\end{aligned}
\qquad (6.14.16)
$$

where

q_{rsulf_FeOH2} = the iron hydroxide sulfidation rate (mol H_2S s^{-1}),
q_{rsulf_Fe} = the iron sulfidation rate (mol H_2S s^{-1}),
q_{rcarb_MgOH2} = the $MgOH_2$ carbonation rate (mol CO_2 s^{-1}),
q_{rcarb_MgO} = the MgO carbonation rate (mol CO_2 s^{-1})
q_{rsulf} = calculated in Equation 6.14.15,
q_{rcarb} = calculated in Equation 6.14.15.

When the Fe and $Fe(OH)_2$ concentrations are zero, the sulfidation rates are both zero, while when the MgO and $Mg(OH)_2$ concentrations are zero, the carbonation rates are both zero.

The cellulosics microbial degradation dependent chemistry rates are tested at t = 3.1557E+09 s for elements 7, 8 and 9 (grid blocks (6,1,1), (10,1,1) and (14,1,1)), where the microbial degradation rates and Fe, $Fe(OH)_2$, MgO and $Mg(OH)_2$ concentrations are given in the BRAGFLO output file as follows:

q_{rmi}(Waste 2 @ 3.1557E+09 s) = 0.00000E+00 mol CH_2O s^{-1} {cell D100}

q_{rmi}(Waste 3 @ 3.1557E+09 s) = 9.00000E-09 mol CH_2O s^{-1} {cell D101}

q_{rmi}(Waste 4 @ 3.1557E+09 s) = 1.10000E-08 mol CH_2O s^{-1} {cell D102}

C_{Fe} (Waste 2 @ 3.1557E+09 s) = 0.00000E+00 kg Fe m^{-3} {line 110}

C_{Fe} (Waste 3 @ 3.1557E+09 s) = 0.00000E+00 kg Fe m^{-3} {line 111}

C_{Fe} (Waste 4 @ 3.1557E+09 s) = 1.04170E+02 kg Fe m^{-3} {line 112}

C_{FeOH2} (Waste 2 @ 3.1557E+09 s) = 0.00000E+00 kg $Fe(OH)_2$ m^{-3} {line 113}

C_{FeOH2} (Waste 3 @ 3.1557E+09 s) = 0.00000E+00 kg $Fe(OH)_2$ m^{-3} {line 114}

C_{FeOH2} (Waste 4 @ 3.1557E+09 s) = 7.82065E+00 kg $Fe(OH)_2$ m^{-3} {line 115}

C_{MgO} (Waste 2 @ 3.1557E+09 s) = 9.60093E+01 kg MgO m^{-3} {line 116}

C_{MgO} (Waste 3 @ 3.1557E+09 s) = 7.85457E+01 kg MgO m^{-3} {line 117}

C_{MgO} (Waste 4 @ 3.1557E+09 s) = 0.00000E+00 kg MgO m^{-3} {line 118}

C_{MgOH2} (Waste 2 @ 3.1557E+09 s) = 2.02443E+01 kg $Mg(OH)_2$ m^{-3} {line 119}

C_{MgOH2} (Waste 3 @ 3.1557E+09 s) = 1.49177E+01 kg $Mg(OH)_2$ m^{-3} {line 120}

C_{MgOH2} (Waste 4 @ 3.1557E+09 s) = 0.00000E+00 kg $Mg(OH)_2$ m^{-3} {line 121}

The following parameters are read from the input file and echoed to the output file:

$s_{sulf}(1)$ = H_2S stoichiometric coefficient (1) = 5.00E-01 {line 122}

$s_{sulf}(2)$ = H_2S stoichiometric coefficient (2) = 5.00E-01 {line 123}

$s_{carb}(1)$ = CO_2 stoichiometric coefficient (1) = 1.00E+00 {line 124}

$s_{carb}(2)$ = CO_2 stoichiometric coefficient (2) = 1.00E+00 {line 125}

Calculating the sulfidation and carbonation rates from Equations 6.14.15 and using these values in Equation 6.14.16 gives

q_{rsulf_FeOH2}(Waste 2 @ 3.1557E+09 s) = 0.0000E+00 mol H_2S s^{-1} {cell E132}

q_{rsulf_FeOH2}(Waste 3 @ 3.1557E+09 s) = 0.0000E+00 mol H_2S s^{-1} {cell E133}

q_{rsulf_FeOH2}(Waste 4 @ 3.1557E+09 s) = 5.5000E-09 mol H_2S s^{-1} {cell E134}

q_{rsulf_Fe}(Waste 2 @ 3.1557E+09 s) = 0.0000E+00 mol H_2S s^{-1} {cell E135}

q_{rsulf_Fe}(Waste 3 @ 3.1557E+09 s) = 0.0000E+00 mol H_2S s^{-1} {cell E136}

q_{rsulf_Fe}(Waste 4 @ 3.1557E+09 s) = 0.0000E+00 mol H_2S s^{-1} {cell E137}

q_{rcarb_MgOH2}(Waste 2 @ 3.1557E+09 s) = 0.0000E+00 mol CO_2 s^{-1} {cell E138}

q_{rcarb_MgOH2}(Waste 3 @ 3.1557E+09 s) = 9.0000E-09 mol CO_2 s^{-1} {cell E139}

q_{rcarb_MgOH2}(Waste 4 @ 3.1557E+09 s) = 0.0000E+00 mol CO_2 s^{-1} {cell E140}

q_{rcarb_MgO}(Waste 2 @ 3.1557E+09 s) = 0.0000E+00 mol CO_2 s^{-1} {cell E141}

q_{rcarb_MgO}(Waste 3 @ 3.1557E+09 s) = 0.0000E+00 mol CO_2 s^{-1} {cell E142}

q_{rcarb_MgO}(Waste 4 @ 3.1557E+09 s) = 0.0000E+00 mol CO_2 s^{-1} {cell E143}

This independent calculations of the cellulosics microbial degradation dependent chemistry rates agree within three to four significant digits with the values obtained from the BRAGFLO output file {cells D132-D143} (0.00000E+00, 0.00000E+00, 5.50000E-09, 0.00000E+00, 0.00000E+00, 7.18117E-39, 0.00000E+00, 9.00000E-09, 0.00000E+00, 0.00000E+00, 1.94227E-78, 0.00000E+00). The values of 7.18117E-39 and 1.94227E-78 are calculated as 0.00000E+00 which is well below the numerical precision of both the BRAGFLO and Excel, therefore this difference is acceptable.

As seen in the output file and the independent calculations, the cellulosics microbial degradation dependent chemistry rates for element 7 are zero, since the microbial degradation rate is zero. Furthermore, the sulfidation rates for element 8 and the carbonation rates for element 9 are zero, since there is no Fe or MgO present, respectively.

The agreement between these calculations and the BRAGFLO output verifies that the cellulosics microbial degradation dependent chemistry rates are being treated correctly in BRAGFLO, and verifies Functional Requirements R.20, R.21, and R.22.

6.14.4.6 Additional Chemistry Tests

Additional quantities related to the chemistry rates (Table 6.14.2) can be tested if desired, using the stoichiometric factors listed in Table 6.14.3.

TABLE 6.14.2 Additional Chemistry Rates in Test Case #14.

Variable Name	Description	Units
H2RATE	H_2 generation rate–simple model	kg/(s·m^3)
BRINRATE	Brine consumption rate–simple model	kg/(s·m^3)
FERATE	Fe consumption rate–simple model	kg/(s·m^3)
CELLRATE	Biodegrad consumption rate–simple model	kg/(s·m^3)
FEOH2R	$Fe(OH)_2$ generation rate–simple model	kg/(s·m^3)
FESR	FeS generation rate–simple model	kg/(s·m^3)
MGOR	MgO generation rate–simple model	kg/(s·m^3)
MGOH2R	$Mg(OH)_2$ generation rate–simple model	kg/(s·m^3)
MGCO3R	$MgCO_3$ generation rate–simple model	kg/(s·m^3)

TABLE 6.14.3 Test Case #14 Stoichiometric Coefficients.

Rxn #	1	2	3	4	5	6	7
Variable	CORRATI	BIORATI	FEOH2_SR	FE_SR	MGO_HR	MGOH2_CR	MGO_CR
H2RATE	1	0.5	0	0	0	0	0
BRINRATE	-2	0	2	0	-1	1	0
FERATE	-1	0	0	-1	0	0	0
CELLRATE	0	-1	0	0	0	0	0
FEOH2R	1	0	-1	0	0	0	0
FESR	0	0	1	1	0	0	0
MGOR	0	0	0	0	-1	0	-1
MGOH2R	0	0	0	0	1	-1	0
MGCO3R	0	0	0	0	0	1	1

The additional chemistry rates in the first column of Table 6.14.3 can be calculated by multiplying the rates listed in row 2 of Table 6.14.3 by the corresponding stoichiometric coefficients in the table. For example, the calculation the variable FESR would be one times FEOH2_SR plus one times FE_SR. Because the consumption rates are reported in kg m^{-3} s^{-1}, the molecular weight of each species, which should be found in the output file, are also needed for comparison. For this example the variable FESR, would be multiplied by the molecular weight of FeS.

The brine consumption rate (BRINRATE) will be multiplied by the molecular weight of brine, which is calculated from the salinity of the brine, m_s, in weight percent salt and the molecular weight of H_2O, M_{w,H_2O}, which should be obtained from the output file, where it is echoed from the input:

$$m_s \quad = \text{SALT} \quad = 29.6 \text{ wt \%}.$$

To get the brine consumption rate, it is multiplied by the effective brine molecular weight, $M_{w,brine}$:

$$MW_{brine} = \frac{MW_{H_2O}}{1 - \dfrac{m_s}{100}} \tag{6.14.17}$$

The addtional chemistry rates are tested at t = 3.1557E+09 s for elements 7, 8 and 9 (grid blocks (6,1,1), (10,1,1) and (14,1,1)), where the iron corrosion rates, microbial degradation rates, Fe and $Fe(OH)_2$ sulfidation rates, MgO hydration rates and MgO and $Mg(OH)_2$ carbonation rates are given in the BRAGFLO output file as follows:

q_{rci}(Waste 2 @ 3.1557E+09 s) = 0.0000E+00 mol Fe s^{-1} {cell D95}

q_{rci}(Waste 3 @ 3.1557E+09 s) = 0.0000E+00 mol Fe s^{-1} {cell D96}

q_{rci}(Waste 4 @ 3.1557E+09 s)	= 3.3000E-08 mol Fe s^{-1}	{cell D97}

MGCO3R(Waste 4 @ 3.1557E+09 s)	= 0.0000E+00 kg $MgCO_3$ s^{-1}	{cell E245}

This independent calculations of the cellulosics microbial degradation dependent chemistry rates agree within three to four significant digits with the values obtained from the BRAGFLO output file {cells D219-D245} (0.00000E+00, 9.07155E-12, 7.76122E-11, -2.93143E-09, -2.15860E-09, -1.46572E-09, 0.00000E+00, 0.00000E+00, -1.84295E-09, 0.00000E+00, -2.43207E-10, -2.97253E-10, 0.00000E+00, 0.00000E+00, 2.47120E-09, 0.00000E+00, 0.00000E+00, 4.83450E-10, -4.43348E-09, -3.62740E-09, 0.00000E+00, 6.41516E-09, 4.72389E-09, 0.00000E+00, 0.00000E+00, 7.58828E-10, 0.00000E+00).

The agreement between these calculations and the BRAGFLO output verifies that the additional chemistry rates are being treated correctly in BRAGFLO, and verifies Functional Requirements R.20, R.21, and R.22.

6.14.4.7 Solids Production

As the chemical reactions occur, different chemical species with varying densities are produced, changing the volume of the solids. The total change in the volume of solids, ΔV_s (m^3 solid/m^3 grid), can be calculated by:

$$\Delta V_s = \sum_i \Delta V_{si} \tag{6.14.18}$$

where the volume change for species i, ΔV_{si} (m^3 species i/m^3 grid), is:

$$\Delta V_{si} = \frac{C_i - C_i^0}{\rho_i} \tag{6.14.19}$$

where

C_i = the concentration of species i (kg species i/m^3 grid),
C_i^0 = the initial concentration of species i (kg species i/m^3 grid),
ρ_i = the density of species i (kg species i/ m^3 species i).

The solid production model is tested at t = 3.1557E+09 s for elements 7, 8 and 9 (grid blocks (6,1,1), (10,1,1) and (14,1,1)), where the CH_2O, Fe, $Fe(OH)_2$, FeS, MgO, $Mg(OH)_2$, $MgCO_3$ and salt, current and initial concentrations are given in the BRAGFLO output file as follows:

C_{CH2O} (Waste 2 @ 3.1557E+09 s)	= 0.00000E+00 kg CH_2O m^{-3}	{line 247}
C_{CH2O} (Waste 3 @ 3.1557E+09 s)	= 4.42325E+01 kg CH_2O m^{-3}	{line 248}
C_{CH2O} (Waste 4 @ 3.1557E+09 s)	= 5.40620E+01 kg CH_2O m^{-3}	{line 249}
C_{Fe} (Waste 2 @ 3.1557E+09 s)	= 0.00000E+00 kg Fe m^{-3}	{line 250}
C_{Fe} (Waste 3 @ 3.1557E+09 s)	= 0.00000E+00 kg Fe m^{-3}	{line 251}
C_{Fe} (Waste 4 @ 3.1557E+09 s)	= 1.04170E+02 kg Fe m^{-3}	{line 252}
C_{FeOH2} (Waste 2 @ 3.1557E+09 s)	= 0.00000E+00 kg $Fe(OH)_2$ m^{-3}	{line 253}
C_{FeOH2} (Waste 3 @ 3.1557E+09 s)	= 0.00000E+00 kg $Fe(OH)_2$ m^{-3}	{line 254}
C_{FeOH2} (Waste 4 @ 3.1557E+09 s)	= 7.82065E+00 kg $Fe(OH)_2$ m^{-3}	{line 255}
C_{FeS} (Waste 2 @ 3.1557E+09 s)	= 0.00000E+00 kg FeS m^{-3}	{line 256}
C_{FeS} (Waste 3 @ 3.1557E+09 s)	= 0.00000E+00 kg FeS m^{-3}	{line 257}
C_{FeS} (Waste 4 @ 3.1557E+09 s)	= 1.52562E+00 kg FeS m^{-3}	{line 258}
C_{MgO} (Waste 2 @ 3.1557E+09 s)	= 9.60093E+01 kg MgO m^{-3}	{line 259}
C_{MgO} (Waste 3 @ 3.1557E+09 s)	= 7.85457E+01 kg MgO m^{-3}	{line 260}
C_{MgO} (Waste 4 @ 3.1557E+09 s)	= 0.00000E+00 kg MgO m^{-3}	{line 261}
C_{MgOH2} (Waste 2 @ 3.1557E+09 s)	= 2.02443E+01 kg $Mg(OH)_2$ m^{-3}	{line 262}
C_{MgOH2} (Waste 3 @ 3.1557E+09 s)	= 1.49177E+01 kg $Mg(OH)_2$ m^{-3}	{line 263}
C_{MgOH2} (Waste 4 @ 3.1557E+09 s)	= 0.00000E+00 kg $Mg(OH)_2$ m^{-3}	{line 264}
C_{MgCO3} (Waste 2 @ 3.1557E+09 s)	= 0.00000E+00 kg $MgCO_3$ m^{-3}	{line 265}

C^0_{Fe} (Waste 3)	= 0.00000E+00 kg Fe m^{-3}	{line 275}
C^0_{Fe} (Waste 4)	= 1.10000E+02 kg Fe m^{-3}	{line 276}
C^0_{FeOH2} (Waste 2)	= 0.00000E+00 kg $Fe(OH)_2$ m^{-3}	{line 277}
C^0_{FeOH2} (Waste 3)	= 0.00000E+00 kg $Fe(OH)_2$ m^{-3}	{line 278}
C^0_{FeOH2} (Waste 4)	= 0.00000E+00 kg $Fe(OH)_2$ m^{-3}	{line 279}
C^0_{FeS} (Waste 2)	= 0.00000E+00 kg FeS m^{-3}	{line 280}
C^0_{FeS} (Waste 3)	= 0.00000E+00 kg FeS m^{-3}	{line 281}
C^0_{FeS} (Waste 4)	= 0.00000E+00 kg FeS m^{-3}	{line 282}
C^0_{MgO} (Waste 2)	= 1.10000E+02 kg MgO m^{-3}	{line 283}
C^0_{MgO} (Waste 3)	= 9.00000E+01 kg MgO m^{-3}	{line 284}
C^0_{MgO} (Waste 4)	= 0.00000E+00 kg MgO m^{-3}	{line 285}
C^0_{MgOH2} (Waste 2)	= 0.00000E+00 kg $Mg(OH)_2$ m^{-3}	{line 286}
C^0_{MgOH2} (Waste 3)	= 0.00000E+00 kg $Mg(OH)_2$ m^{-3}	{line 287}
C^0_{MgOH2} (Waste 4)	= 0.00000E+00 kg $Mg(OH)_2$ m^{-3}	{line 288}
C^0_{MgCO3} (Waste 2)	= 0.00000E+00 kg $MgCO_3$ m^{-3}	{line 289}
C^0_{MgCO3} (Waste 3)	= 0.00000E+00 kg $MgCO_3$ m^{-3}	{line 290}
C^0_{MgCO3} (Waste 4)	= 0.00000E+00 kg $MgCO_3$ m^{-3}	{line 291}
C^0_{Salt} (Waste 2)	= 0.00000E+00 kg Salt m^{-3}	{line 292}
C^0_{Salt} (Waste 3)	= 0.00000E+00 kg Salt m^{-3}	{line 293}
C^0_{Salt} (Waste 4)	= 0.00000E+00 kg Salt m^{-3}	{line 294}

The following parameters are read from the input file and echoed to the output file:

ρ_{CH2O}	= CH_2O density	= 1.1000E+03	{line 295}
ρ_{Fe}	= Fe density	= 7.8700E+03	{line 296}
ρ_{FeOH2}	= $Fe(OH)_2$ density	= 3.4000E+03	{line 297}
ρ_{FeS}	= FeS density	= 4.7000E+03	{line 298}
ρ_{MgO}	= MgO density	= 3.6000E+03	{line 299}
ρ_{MgOH2}	= $Mg(OH)_2$ density	= 2.3700E+03	{line 300}
ρ_{MgCO3}	= $MgCO_3$ density	= 3.0500E+03	{line 301}
ρ_{Salt}	= Salt density	= 2.1700E+03	{line 302}

Calculating the solids produced for each species from Equations 6.14.19 and using these values in Equation 6.14.18 gives

ΔV_s (Waste 2 @ 3.1557E+09 s)	= 6.03681E-03 m^3 solid/m^3 grid	{cell E327}
ΔV_s (Waste 3 @ 3.1557E+09 s)	= 4.21783E-03 m^3 solid/m^3 grid	{cell E328}
ΔV_s (Waste 4 @ 3.1557E+09 s)	= 1.72386E-03 m^3 solid/m^3 grid	{cell E329}

This independent calculations of the solids production model agree within three to four significant digits with the values obtained from the BRAGFLO output file {cells D327-D329} (6.03680E-03, 4.21786E-03, 1.72386E-03).

The agreement between these calculations and the BRAGFLO output verifies that the solids production model is being treated correctly in BRAGFLO, and verifies Functional Requirements R.23.

6.14.4.8 Smooth Permeability

For Test Case #14, the permeability of materials are smoothly varied in time. This is done on a logarithm basis, since these changes occur over several orders of magnitude. The smoothed permeability, k_{smooth}, is calculated by:

$$\ln(k_{smooth}) = \ln(k_{init}) + f(t_n)\left[\ln(k_{final}) - \ln(k_{init})\right] \tag{6.14.20}$$

$$f(t_n) = \left(c_1 + c_2 t_n + c_3 t_n^{\,2} + c_4 t_n^{\,3} + c_5 t_n^{\,4} + c_6 t_n^{\,5} + c_7 t_n^{\,6} + c_8 t_n^{\,7}\right) \tag{6.14.21}$$

$$t_n = \begin{cases} 0 & t \le t_{init} \\ \dfrac{t - t_{init}}{t_{final} - t_{init}} & t_{init} < t < t_{final} \\ 1 & t \ge t_{final} \end{cases} \tag{6.14.22}$$

$$t_{init} = t_{final} - t_{change} \tag{6.14.23}$$

where

k_{init} = the initial permeability of the material (m^2),
k_{final} = the final permeability of the material (m^2),
c_i = the eight coefficients in the smoothing function $f(t_n)$,
t_n = the normalized time factor,
t_{init} = the time for the permeability change to begin (s),
t_{final} = the time for the permeability change to end (s),
t_{change} = the time range for the permeability change (s).

The smooth permeability model is tested at t = 3.9447E+10 s and 2.6035E+11 for element 18 (grid blocks (18,1,1). The smooth permeability model uses the time value from the previous timestep for the calculations which are given in the BRAGFLO output file as follows:

t @ 3.9447E+10 s	= 3.9333E+10 s	{line 332}
t @ 2.6035E+11 s	= 2.6024E+11 s	{line 333}

The following parameters are read from the input file and echoed to the output file:

$k_{init}(1)$	= initial permeability 1	= 1.0000E-11	{line 334}
$k_{final}(1)$	= final permeability 1	= 1.0000E-15	{line 335}
$t_{final}(1)$	= permeability change end time 1	= 6.3114E+10	{line 336}
$t_{change}(1)$	= permeability change time 1	= 3.1557E+10	{line 337}
$c_1(1)$	= smoothing coefficient 1	= 0.0000E+00	{line 338}
$c_2(1)$	= smoothing coefficient 2	= 0.0000E+00	{line 339}
$c_3(1)$	= smoothing coefficient 3	= 1.1000E+01	{line 340}

$c_4(1)$	= smoothing coefficient 4	= -5.0000E+01	{line 341}
$c_5(1)$	= smoothing coefficient 5	= 1.2000E+02	{line 342}
$c_6(1)$	= smoothing coefficient 6	= -1.6000E+02	{line 343}
$c_7(1)$	= smoothing coefficient 7	= 1.1200E+02	{line 344}
$c_8(1)$	= smoothing coefficient 8	= -3.2000E+01	{line 345}
$k_{init}(2)$	= initial permeability 2	= 1.0000E-15	{line 346}
$k_{final}(2)$	= final permeability 2	= 1.0000E-11	{line 347}
$t_{final}(2)$	= permeability change end time 2	= 2.8402E+11	{line 348}
$t_{change}(2)$	= permeability change time 2	= 3.1557E+10	{line 349}
$c_1(2)$	= smoothing coefficient 1	= 0.0000E+00	{line 350}
$c_2(2)$	= smoothing coefficient 2	= 1.0000E+00	{line 351}

Calculating the smoothed permeabilities from Equations 6.14.20-23 gives

k_{smooth} @ 3.9447E+10 s	= 1.0947E-12 m^2	{cell E360}
k_{smooth} @ 2.6035E+11 s	= 9.6664E-15 m^2	{cell E361}

These independent calculations of the smooth permeabilties agree within three to four significant digits with the values obtained from the BRAGFLO output file {cells D360 & D361} (1.09466E-12, 9.66640e-15).

The agreement between these calculations and the BRAGFLO output verifies that the smooth permeability model is being treated correctly in BRAGFLO, and verifies Functional Requirements R.24.

6.14.4.9 ES40 and ES45

The ASCII output files, BF2_QB0600_ES40_TEST14.OUT and BF2_QB0600_ES45_TEST14.OUT, from Test Case #14 of BRAGFLO 6.0 run on the ES40 and ES45, respectively, are compared to the output file, BF2_QB0600_ES47_TEST14.OUT, using the VMS DIFFERENCE command, with the results stored in BF2_QB0600_ES40_TEST14_OUT.DIF and BF2_QB0600_ES45_TEST14_OUT.DIF (Appendix A.14.4), respectively. Examinations of these files show that there are no differences other than run dates and times, file and directory names, platform names, and execution statistics.

7.0 CONCLUSION

The testing for BRAGFLO as prescribed by the RD/VVP has been completed and all acceptance criteria have been satisfied. The test set documented in Section 6 provides complete validation of all requirements and additional functionalities, as specified by the RD/VVP.

Visual inspection of the ASCII output and independent calculations show that BRAGFLO 6.0 is valid on the ES47 running OpenVMS 8.2. There are no differences in values of output variables between the output from the ES40 and ES45 compared with the ES47. Based on the independent calculations and comparison of the output files, we conclude that BRAGFLO 6.0 satisfies the acceptance criteria specified in the RD/VVP (Nemer, 2007) and is valid on the ES40, ES45 and ES47 running OpenVMS 8.2.
