- manual inspection,	<input type="checkbox"/> Yes	<input type="checkbox"/> No	<input checked="" type="checkbox"/> N/A	<input type="checkbox"/> N/R
- calculations using comparable proven problems,	<input checked="" type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> N/A	<input type="checkbox"/> N/R
- empirical data and information from confirmed published data and correlations and/or technical literature,	<input checked="" type="checkbox"/> Yes	<input type="checkbox"/> No	<input checked="" type="checkbox"/> N/A	<input type="checkbox"/> N/R
- other validated software of similar purpose,	<input checked="" type="checkbox"/> Yes	<input type="checkbox"/> No	<input type="checkbox"/> N/A	<input type="checkbox"/> N/R
- other independent software of similar purpose.	<input type="checkbox"/> Yes	<input type="checkbox"/> No	<input checked="" type="checkbox"/> N/A	<input type="checkbox"/> N/R
7. Test Documentation Acceptability
Do the tests meet the acceptance criteria identified in an approved VVP? Yes No N/A N/R
8. Test Documentation Repeatability
Are the tests documented in sufficient detail such that they can be repeated? Yes No N/A N/R
9. Computer File Documentation
Are the test case input and output files included in the Validation Document? Yes No N/A N/R
10. Understandability of Documentation
Are the validation methods, test data, results, and conclusions documented in a form that can be understood by an independent, technically competent individual? Yes No N/A N/R

1.0 INTRODUCTION

The purpose of this document is to summarize the results of the testing activities prescribed in the RD/VVP for Version 2.40 of FMT and to provide evaluations based on those results. The FMT code has previously undergone a complete WIPP QAP 19-1 quality assurance process.

2.0 TESTING ENVIRONMENT

Testing for FMT was performed in the following computer environment:

Hardware platform: DEC Alpha
Operating System: OpenVMS version 7.1
Directory: WP\$NONPA_TESTROOT:[FMT]

3.0 TEST TOOLS

The testing tools which were used as part of the software validation are described in **Table 3.0.1**.

Table 3.0.1 Software Testing Tools

Tool Name	Usage
FORTRAN-Lint (FLINT)	Source Code Analyzer used to identify non ANSI standard coding.
DECset SCA	Source Code analyzer used to identify uncalled modules, to display the calling tree, and to identify the modules used in the analysis.
DECset PCA	Performance Coverage Analyzer, used to identify any unexercised modules
DEC FORTRAN Compiler version EV6.2-508-274	Compiler, used to create the executables and identify compilation errors and warnings.

4.0 STATIC ANALYSIS

For FMT, static analysis was performed using both the source code analyzer FLINT and the source code analyzer DECset-SCA . The analysis was performed in the directory of

WP\$NONPA_TESTROOT:[FMT.SCA]

FLINT was used to detect non-ANSI standard FORTRAN coding. DECset-SCA was used to reveal any uncalled modules, to display the calling tree, and to identify the modules used in the analysis.

4.1 FLINT Analysis: Procedure and Results

PROCEDURE: Since FMT is a multimodule program, FLINT was used on a file created by appending all the modules together. The resulting file is FMT_QB0204.FOR. The file resulting from running FLINT,

FMT_FLINT_QB0204.FLI,

is shown in **Figure 4.1.1**.

RESULTS: As a result of running FLINT, it was noted that several variables were defined but not referenced. This was as expected by the code sponsor.

4.2 SCA Analysis: Procedure and Results

PROCEDURE: DECset-SCA was invoked during the build process. The build process was performed using the build script WP_BUILD.COM developed by the SCMS librarian. The build script was fetched from the WP library with the following commands:

```
libwp
cfe wp_build.com
```

The build script is self-contained and is executed in the directory containing the needed input files with the command,

```
@wp_build
```

During the build process, the input file, the input file FMT.MMS is required and is fetched from SCMS. That input file is shown in **Figure 4.2.1**.

As a result of the build process, a debug executable capable of doing PCA analysis was created and the SCA code analyzer created the three output files. These files are listed in **Table 4.2.1** along with a brief description of each file and a reference to where a listing of each file can be found in this document.

Table 4.2.1 Files Created by the SCA Code Analyzer

Output File	Description	Figure
FMT_SCA_MOD_NOT_REF.TXT	A listing of the modules in the code that are not referenced	Figure 4.2.1
FMT_CALLTREE.TXT	A listing of the calling tree for the code	Figure 4.2.2
SCA\$EVENT.DAT	A binary file containing information about the SCA process	

Following the build process, SCA was invoked at the VMS \$ prompt and the following commands were executed on the SCA\$EVENT.DAT file in the WP\$NONPA_TESTROOT: [FMT.SCA] directory:

```
SCA> set lib []
SCA> show module/all/output=FMT_modules_QB0204.out
SCA> exit
```

This procedure converts information in the binary file to ASCII format. The resulting ASCII file, FMT_MODULES_QB0204.OUT, is shown in **Figure 4.2.3**.

The somewhat generic text filenames were changed to include the version number for unique identification prior to submitting them into SCMS. That is,

```
FMT_SCA_MOD_NOT_REF.TXT became FMT_SCA_MOD_NOT_REF_QB0204.TXT and
FMT_CALLTREE.TXT became FMT_CALLTREE_QB0204.TXT.
```

RESULTS: The SCA procedure revealed that the main program itself was not called, as was expected. In addition, the following function ITOCHAR was uncalled. Examination of the call tree output showed that the function was called, and when the DEC search utility was used on the FMT_QB0204.FOR source file, it was clearly shown that in fact the function ITOCHAR was called several times. The anomaly of the finding by SCA cannot be explained, but it is believed that there are no uncalled subroutines or functions in FMT. The file resulting from using the DEC search utility, FMT_ITOCHAR_QB0204.SEA is shown in **Figure 4.2.4**.

5.0 COVERAGE ANALYSIS

The coverage analysis for FMT was performed using DECset PCA. A unique executable, called FMT_TEST_PCA_QB0204.EXE was created for the purpose of coverage analysis. This executable was generated by using the SCMS build script, WP_BUILD.COM and placed in the WP\$NONPA_TESTROOT:[FMT.EXE] directory. The coverage analysis was performed in the WP\$NONPA_TESTROOT:[FMT.PCA] directory.

The command file FMT_PCA_QB0204.COM, shown in **Figure 5.0.1**, was used to run the FMT test cases with PCA. A log of the PCA analysis, FMT_PCA_QB0204.LOG, resulting from running the script was created. An edited listing of that file can be seen in **Figure 5.0.2**. It was edited to remove echo from the running of the code. The unedited log file has been retained in SCMS. The cumulative PCA results, FMT_COVER_CUM_QB0204.TXT, for all the test cases can be seen in **Figure 5.0.3**.

Modules ACTBDOT, EHCALC, and VSFCHG perform the functionalities that are not supported by the current version of the code, and therefore they are not covered in the coverage analysis. Module SHFTRID is used to eliminate one of the species involved in a solids-only reaction in the numerical iteration for chemical equilibrium calculations. The module is called only occasionally, depending on testing problems. Therefore, the zero coverage of module SHFTRID for the given set of testing cases is not unexpected. All the other modules are covered in the coverage analysis.

6.0 FUNCTIONAL TESTING

A total of 8 test cases were provided for FMT functional testing. The test cases were run in the directory WP\$NONPA_TESTROOT:[FMT.TESTCASES], and all files associated with the functional testing are located in this directory. To run the test cases a script, FMT_TEST_QB0204.COM, was used. A listing of the script can be seen in **Figure 6.0.1**. A log of the testing procedure, FMT_TEST_QB0204.LOG, was created during the running of the script. A listing of that log file can be seen in **Figure 6.0.2**

All required input files were fetched using the CFG command from the CMS procedures. Two databases are required for all test cases. They are

FMT_PH_070407.CHEMDAT, and
FMT_HMW_AM3PU3TH4NP5_960823.RHOMIN

A list of the functional requirements for FMT follows. A summary of the requirements tested by each of the eight test cases can be found in **Table 6.0.1**. An evaluation of the individual test cases can be found in Sections 6.1-6.8.

Functional Requirements

- R.1 - FMT predicts mineral solubilities in the Na-K-Mg-Ca-H-Cl-SO₄-OH-HCO₃-CO₃-CO₂-B(OH)₃-H₂O to high ionic strength at 25°.
- R.2 - FMT predicts solubility behaviour of Am(III), Th(IV), and Np(V) in brines such as those found in Castile, Rustler, and Salado Formations near the Waste Isolation Pilot Plant (WIPP).
- R.3 - The batch simulation mode, also know as flash problems, calculates chemical equilibrium for a given set of element abundance.
- R.4 - FMT supports three titration calculation modes: user-specified increments, linear increments, and logarithmic increments.
- R.5 - FMT fixes solution pH or f_{CO_2} as specified in an input file.
- R.6 - FMT disables any chemical species as specified in an input file.

Performance Requirements

This code has no performance requirements.

Attribute Requirements

This code has no attribute requirements.

External Interface Requirements

- R.7 - The parameters in the actinide series used in the FMT database are calculated by NONLIN or other equivalent means.

Other Requirements

There are no other requirements for FMT that need verification.

Table 6.0.1 Requirement Coverage by Test Cases

		1	2	3	4	5	6	7	8

6.1 Test Case #1: Speciation in WIPP SPC (Salado Primary Constituent) Brine

6.1.1 Test Objectives

The "batch" mode is used to calculate the species concentrations in the WIPP SPC brine. The SPC brine has been used to represent the WIPP Salado brine in various experiments measuring colloidal and dissolved actinide concentrations. This test case is to test the FMT equilibrium calculation for nonradioactive chemical components. It will test functional requirements R.1 and R.3.

6.1.2 Test Procedures

This test case was run using the script FMT_TEST_QB0204.COM. This command file is shown in **Figure 6.0.2**.

6.1.3 Input/Output Files

The following is a list of all files associated with Test Case #1:

Command file:

FMT_TEST_QB0204.COM

Input files:

FMT_SPC_BM.IN (See **Figure 6.1.1**)
FMT_SPC_BM.INGUESS

Output files:

FMT_SPC_BM_QB0204.OUT (See **Figure 6.1.2**)

In this case, FMT_SPC_BM.INGUESS is used as a dummy input file and thus it is not listed here.

6.1.4 Evaluation

Since no modification has been made for the component Na-K-Ca-Mg-Cl-C-S-B-Br-H-O in FMT_PH_970407.CHEMDAT, the calculated species concentrations were expected to agree with those calculated by FMT version 2.3. The agreement was expected to be to 6 significant digits.

Figure 6.1.3 shows an edited listing of the output file FMT_SPC_BM_230.OUT resulting from calculations from version 2.3 of FMT. The entire output file is stored in SCMS. Tables 6.1.1 and 6.1.2 show the comparisons between the concentration calculated by versions 2.3 and 2.4 of FMT

With the exception of the molality of B(OH)4-, all calculated concentrations are identical. For B(OH)4-, the molality calculated by the two versions differed by one in the 6th significant digit. The acceptance criteria is considered to have been met.

6.2 Test Case #2: Solubility of Hydrated $\text{NaNpO}_2\text{CO}_3$ in NaCl Solution

6.2.1 Test Objectives

The "titration" mode of user-specified increments is used to calculate the solubility of hydrated $\text{NaNpO}_2\text{CO}_3$ in a 5.61 molal NaCl solution as a function of carbonate concentration. This test case is to demonstrate the capability of FMT in the prediction of Np behavior in NaCl-dominated solutions. This test case will test functional requirements R.2, R.4, and R.7.

6.2.2 Test Procedures

This test case was run using the script FMT_TEST_QB0204.COM. This command file is shown in **Figure 6.0.2**.

6.2.4 Evaluation

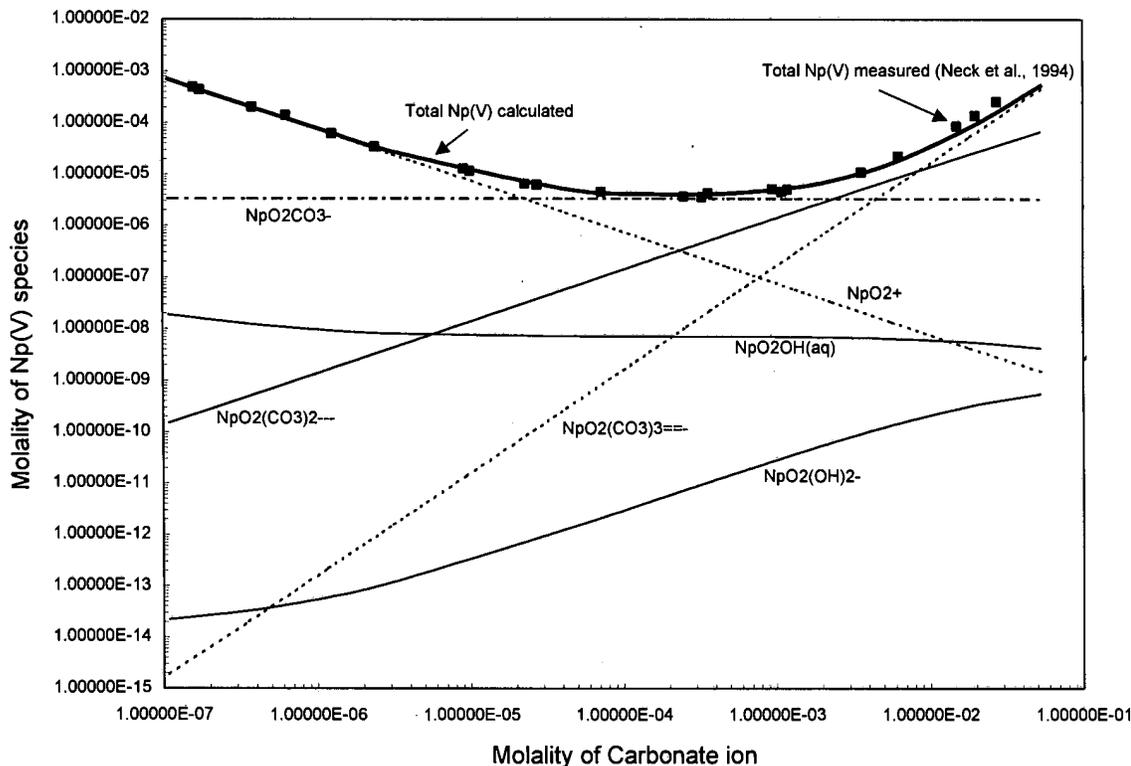

The calculated Np solubility was to be compared with the experimental data from Neck et al. (1994) (Table 6.2.1). The model prediction was expected to follow the general trend of the experimental data and the deviation of the model prediction from the experimental data was to be less than half a logarithmic unit to be acceptable.

Since the m CO₃²⁻ values for the Neck data and the calculated results from FMT were not identical, comparison was made graphically. Figure 6.2.3 shows the output file FMT_NP_NACL_BM_QB0204.OUT edited to show the nonzero concentrations calculated by FMT. Figure 6.2.4 shows the nonzero titration results calculated by FMT. Both output files have been retained unedited in CMS.

Figure 6.2.5 Graphical Comparison of Total Np(V) Species Concentrations as a Function of CO_2^3- in 5.61 Molal NaCl with Experimental Measurements from Neck et al. (1994)

The graphical comparison in **Figure 6.2.5** shows that the calculated values follow the general trend of the experimental data (Neck, 1994). The deviation of the model prediction from the experimental data was shown to be less than half a logarithmic. The acceptance criteria is considered to have been met.

6.3 Test Case #3: ThO₂ (am) Solubility in 6 m NaCl Solution

6.3.1 Test Objectives

This test case used the "titration" mode of logarithmic increments to calculate the solubility of ThO₂ (am) in a 6 m NaCl solution as a function of pcH (= log[molarity of H⁺]). This test case was intended to ascertain if FMT correctly predicts the chemical behavior of Th(IV) in NaCl solutions. It tests functional requirements R.2, R.4, and R.7.

6.3.2 Test Procedures

This test case was run using the script FMT_TEST_QB0204.COM. This command file is shown in **Figure 6.0.2**.

6.3.4 Evaluation

The calculated ThO_2 (am) solubility was to be graphically compared with the experimental data from Rai et al. (1997). The model prediction was expected to follow the general trend of the experimental data and the deviation of the model prediction from the experimental data was to be less than half a logarithmic unit.

Figure 6.3.3 shows the the nonzero concentrations calculated by FMT. Figure 6.3.4 shows the nonzero titration results from FMT. Figure 6.3.5 graphically compares the total Th(IV) calculated by FMT with the experimental measurements of Rai et al. (1997). It can be seen that the deviation of the model prediction from most experimental data points was less that half a logarithmic unit. Considering scattering of the experimental data, the acceptance criteria is considered to have been met.

6.4 Test Case #4: Solubility of $\text{NaAm}(\text{CO}_3)_2 \cdot 6\text{H}_2\text{O}$ in Na_2CO_3 and NaHCO_3 Solutions

6.4.1 Test Objectives

Using the "titration" modes of logarithmic increments and linear increments, respectively, FMT calculates the solubility of $\text{NaAm}(\text{CO}_3)_2 \cdot 6\text{H}_2\text{O}$ in Na_2CO_3 and NaHCO_3 solutions as a function of total carbonate concentration. This test cases addresses requirements R.2, R.4, and R.7.

6.4.2 Test Procedures

This test case was run using the script FMT_TEST_QB0204.COM. This command file is shown in **Figure 6.0.2**.

6.4.3 Input/Output Files

The following is a list of all files associated with Test Case #4:

6.4.4 Evaluation

The calculated $\text{NaAm}(\text{CO}_3)_2 \cdot 6\text{H}_2\text{O}$ solubility was to be graphically compared with the experimental data from Rao et al. (1996). The model prediction was to follow the general trend of the experimental data and the deviation of the model prediction from the experimental data was expected to be less than half a logarithmic unit.

Figures 6.4.5 and 6.4.7 show the nonzero concentrations calculated by FMT. Figures 6.4.6 and 6.4.8 show the nonzero titration results calculated by FMT. Figure 6.4.9 is a graphical comparison of total Am(III) concentrations calculated by FMT with the experimental data from Rao et al. (1996). It can be seen that the model prediction follows the general trend of the experimental data and the deviation of the model prediction from the experimental measurements is less than half a logarithmic unit. Therefore, the acceptance criteria is considered to have been met.

6.5 Test Case #5: Solubility of AmPO₄ in Na₂SO₄ Solutions

6.5.1 Test Objectives

Using the "titration" mode of logarithmic increments, FMT calculates the solubility of AmPO₄ in both 10^{-2.06} m and 10^{-1.12} m Na₂SO₄ solutions as a function of pcH. The solution pcH change was to be made by adding HCl. It tests functional requirements R.2, R.4, and R.7.

6.5.2 Test Procedures

This test case was run using the script FMT_TEST_QB0204.COM. This command file is shown in **Figure 6.0.2**.

6.5.3 Input/Output Files

The following is a list of all files associated with Test Case #5:

6.5.4 Evaluation

The calculated solubility of AmPO_4 was to be graphically compared with the experimental data from Rai et al. (1995) for the solubility of Am(III) in $10^{-3.5}\text{m}$ NaH_2PO_4 media with both $10^{-3.06}\text{m}$ and $10^{-1.12}\text{m}$ Na_2SO_4 as hydrogen ion concentration is changed by the addition of HCl from Rai et al. (1995). The model prediction was to follow the general trend of the experimental data and the deviation of the model prediction from the experimental data was to be less than half logarithmic unit.

Figures 6.5.5 and 6.5.7 show the nonzero concentrations calculated by FMT. Figures 6.5.6 and 6.5.8 show the nonzero titration results from FMT. Figure 6.5.9 is a graph of the comparison of the calculated Am(III) molality with the experimental measurements from Rai et al. (1995). It can be seen that the model prediction follows the general trend of the experimental data and the deviation of the model prediction from the experimental measurements was less than half a logarithmic unit. Therefore, the acceptance criteria is considered to have been met.

6.6 Test Case #6: Fixing CO₂ Fugacity or pH and Disabling Chemical Species as Needed

6.6.1 Test Objectives

This test case is a "Batch calculation for the speciation of a Na-K-Cl-CO₂ solution with a fixed pH of 8.3 and f_{CO_2} of 10^{-4} atm. Species NaCl (halite) and CO₂ (aq) are disabled in the calculation. This test case was to demonstrate the capability of the code for fixing CO₂ fugacity or pH and disabling chemical species as specified in the input file. It tests functional requirements R.5, and R.6.

6.6.2 Test Procedures

This test case was run using the script FMT_TEST_QB0204.COM. This command file is shown in Figure 6.0.2.

NOTES: - Water "molality" is mole fraction H2O in aqueous phase
 - "Descriptor" means:
 *dG/RT/ln10 for species with nonzero concs. (convergence criterion)
 *Saturation Index for minerals, SI=log10(IAP/Ksp)
 *log10(activity) for aqueous species with very small concentrations
 *log10(activity) for aqueous species Not Allowed to Form
 *NAF signifies that the species was Not Allowed to Form

6.6.4 Evaluation

In this case, a sufficient quantity of halite is added to the solution, and precipitation of the mineral would occur if it were not disabled. Similarly, the concentration of CO_2 (aq) would be non-zero, if this species were not disabled. Therefore, the calculated concentrations of both NaCl (halite) and CO_2 (aq) must be zero. The calculated pH and f_{CO_2} must be the same, to four significant digits, as those specified in the input file.

An edited listing of the output file FMT_FCO2_PH_FIXED_QB0204.OUT is shown in **Figure 6.6.3**. The concentrations for both CO_2 (aq) and NaCl(halite) are bolded in the output listing and it can be seen that they are both zero as expected. The pH and f_{CO_2} have also been bolded, and a comparison of the output values with the input values does verify that the values of both remained unchanged as expected. Therefore, the acceptance criteria has been successfully met.

6.7 Test Case #7: Calculation of Chemical Invariant Points

6.7.1 Test Objectives

In this test case, FMT is used to calculate 3 chemical invariant points:

- 1) glaserite + shoenite + sylvite + halite
- 2) halite + teepelite + borax , and
- 3) $\text{KNaCO}_3 \cdot 6\text{H}_2\text{O} + \text{KCl} + \text{K}_2\text{CO}_3 \cdot \frac{3}{2}\text{H}_2\text{O}$.

It tests functional requirements R.1 and R.3.

6.7.2 Test Procedures

This test case was run using the script FMT_TEST_QB0204.COM. This command file is shown in **Figure 6.0.2**.

6.7.3 Input/Output Files

The following is a list of all files associated with Test Case #7:

Command file:

FMT_TEST_QB0204.COM

Input files:

FMT_INVAR_M.IN	(See Figure 6.7.1)
FMT_INVAR_M.INGUESS	(See Figure 6.7.2)
FMT_INVAR_B3.IN	(See Figure 6.7.3)

6.7.4 Evaluation

The calculated total dissolved component concentrations for each chemical invariant point was to be compared with the experimental data from Braitsch (1971), Teeple (1929), and Linke (1958). The deviation of the model prediction from the experimental data was to be less than 30%.

Table 6.7.1 shows the experimental measurements from Braitsch(1971), Table 6.7.2 shows the experimental data published by Teeple (1929), and Table 6.7.3 shows the experimental measurements from Linke(1958).

For part 1, the calculated results from FMT are compared to the lab data published by Braitsch (1971). The calculated results from FMT for molality have been extracted from the FMT_INVAR_M_QB0204.OUT file and are shown in Figure 6.7.7. Table 6.7.1 shows a summary of the comparison where

$$\text{difference} = \frac{m_{i,FMT}^{TTL} - m_{i,data}^{TTL}}{m_{i,data}^{TTL}} \times 100\% \quad (1)$$

The complete output files for each of these test cases have been retained in the SCMS.

Table 6.7.1 FMT Results versus Experimental Measurements from Braitsch (1971) for Invariant Problem M

	m_{Na}^{TTL}	m_k^{TTL}	m_{Mg}^{TTL}	m_{Cl}^{TTL}	m_{SO4}^{TTL}	Solid Phase
Braitsch	2.69	1.58	1.97	6.65	0.78	glaserite, shoenite
FMT	2.63	1.61	2.04	6.72	0.80	Sylvite, halite
Difference	-2.24%	2.13%	3.61%	1.09%	2.76%	

For part 2, the calculated results from FMT are compared to the lab data published by Teeple (1929). The calculated results from FMT for molality have been extracted from the FMT_INVAR_B3_QB0204.OUT file and are presented in Figure 6.7.2. A summary of the comparison can be found in Table 6.7.2.

Table 6.7.2 FMT Results versus Experimental Measurements from Teeple (1929) for Invariant Problem B2

	m_{Na}^{TTL}	m_{Cl}^{TTL}	m_{SO4}^{TTL}	m_{CO3}^{TTL}	m_B^{TTL}	Solid Phase
Teeple	6.97	5.68			1.37	halite,
FMT	7.32	5.80			1.55	teeplite
Difference	4.95%	2.14%			13.38%	borax

For part 3, the calculated results from FMT are compared to the lab data published by Linke(1958). The calculated results from FMT for molality have been extracted from the FMT_INVAR_K4_QB0204.OUT file and are presented in **Figure 6.7.9**. A summary of the comparison can be found in **Table 6.7.3**.

Table 6.7.3 FMT Results versus Experimental Measurements from Linke (1958) for Invariant Problem K4

	m_{Na}^{TTL}	m_k^{TTL}	m_{Cl}^{TTL}	m_{CO3}^{TTL}	Solid Phase
Linke	2.08	15.08	0.25	8.46	sylvite, KNaCO ₃ ·6H ₂ O, K ₂ CO ₃ ·3/2H ₂ O
FMT	1.75	15.09	0.24	8.30	
Difference	-16.10%	0.08%	-4.15%	-1.91%	

To be acceptable, the deviation of the model prediction from the experimental data was to be less than 30%. It can be seen that the deviations are well within this criteria. Therefore, the acceptance criteria is considered to have been met.

6.8 Test Case #8: Speciation of Am(III), Th(IV), and Np(V) in WIPP SPC Brine

6.8.1 Test Objectives

In this test case, FMT is used to calculate the speciation of Am(III), Th(IV), and Np(V) in WIPP SPC brine. This test case was to test if the chemical equilibrium calculation correctly for these radionuclides. It tests functional requirements R.2, R.3, and R.7.

6.8.2 Test Procedures

This test case was run using the script FMT_TEST_QB0204.COM. This command file is shown in **Figure 6.0.2**.

6.8.4 Evaluation

The acceptance criteria for this test case was that mass balance and equilibrium constraints on Am(III), Th(IV), and Np(V) are satisfied. They will be checked by hand calculations.

All problems solved with FMT should satisfy mass balance and equilibrium constraints. All chemical species should satisfy mass balance and equilibrium constraints. For example, for the general balanced chemical reaction

$$\sum_i r_i R_i = \sum_j p_j P_j$$

where r_i = stoichiometric coefficients of the reactant species R_i
 p_j = stoichiometric coefficients of the product species P_j

Equilibrium is given by:

$$\frac{\prod_j a_j^{p_j}}{\prod_i a_i^{r_i}} = \text{EXP} \left(-\sum_j p_j \frac{\mu_j^0}{RT} + \sum_i r_i \frac{\mu_i^0}{RT} \right)$$

where $\frac{\mu_i^0}{RT}$ and $\frac{\mu_j^0}{RT}$ are taken from the CHEMDAT file
 a_i and a_j are the calculated activities for species R_i and P_j respectively

Mass balance is given by:

$$\sum_j \nu_{ij} M_j = A_i \quad i = 1, 2, \dots, I$$

where ν_{ij} = the stoichiometric coefficient of element i in species j
 M_j = "Total Moles" of species j
 A_i = "Elemental Abundance Total Moles" for element i

Mass Balances

The mass balance equations are written disregarding charge on the chemical species.
(M = total number of moles of given species or element.)

Mass Balance for Americium

Total moles of elemental americium =

$$\begin{aligned} & M(\text{AmOHCO}_3) + M(\text{Am}) + M(\text{AmCO}_3) + M(\text{AmOH}) + M(\text{Am}(\text{OH})_2) + M(\text{Am}(\text{CO}_3)_2) + M(\text{Am}(\text{CO}_3)_3) + \\ & M(\text{Am}(\text{OH})_3) \\ & = 6.21811\text{E-}06 + 3.56989\text{E-}06 + 1.81972\text{E-}07 + 1.87358\text{E-}08 + 1.11489\text{E-}08 + 8.04118\text{E-}11 + 6.25941\text{E-}11 \\ & + 3.02061\text{E-}13 \\ & = 1.00000\text{E-}05 \end{aligned}$$

The input value for the elemental abundance total moles of Am is 1.00000E-05

Mass Balance for Thorium

8.0 CONCLUSION

The testing for FMT as prescribed in the Verification and Validation Plan has been completed and all acceptance criteria have been satisfied. The set of test cases provided in Section 6 provide complete coverage of all functional requirements as described in Section 6.0.
