

APPENDIX C2
DATA ACCUMULATED FROM HEADSPACE-GAS ANALYSES

APPENDIX C2 DATA ACCUMULATED FROM HEADSPACE GAS ANALYSES

This appendix presents all available headspace waste characterization data. The data include drum headspace analytical results for approximately 900 drums of transuranic mixed waste from Idaho National Engineering Laboratory (INEL) and Rocky Flats Environmental Technology Site (RFETS). The waste characterization data cut-off date was September 29, 1995. Item Description Code, and Transuranic Package Transporter Content (TRUCON) Code column entries correspond to Waste Matrix Code groups as described in Chapter C, Table C-1.

To reflect expected proportions of different waste types, the data were weighted according to Waste Matrix Code Group volumes reported in the *Waste Isolation Pilot Plant Transuranic Waste Baseline Inventory Report* (BIR). Table C2-1 presents the weighted average headspace concentrations. The Waste Matrix Code Group (WMCG) volumes and the weighting factors used to calculate the average concentrations are presented in Table C2-2.

Before the data could be manipulated, the RFETS database structure was converted into a modified INEL database structure, and the data from the two sites were combined into a single database. The weighted averages were calculated using computer codes developed for this effort that were validated and verified through independent review of the codes and associated documentation.

The database was modified as follows before the weighted averages were calculated:

- TRUCON codes assigned to each waste drum were converted to a Waste Stream ID using the cross-correlation table in the BIR (DOE 1995a, app. F).
- The Waste Profile Forms from the BIR (DOE 1995a, vol. II) were used to determine the WMCG for each waste stream.
- If the data qualifier was "U," then one-half of the associated value, the sample quantitation limit (SQL) was used for the concentration in calculating the weighted average.
- If the qualifier was "E" or "JE" and a dilution analysis was available for that sample number, the dilution analysis was used for all analytes. Analytes in the diluted sample, qualified as "U," were treated as above.
- All "J"-qualified (estimated) data were used.
- All "B"-qualified (constituent found in blanks) data were used. This was a conservative treatment of the data in the absence of information on the level of contamination observed in the blank.

1 All WMCGs, with the exception of soils and unknown waste, were represented by the data from
2 the INEL and RFETS. Since the soils and unknown waste groups comprise a small percentage
3 of the entire inventory (0.74 and 0.97 percent, respectively), their contribution to the calculated
4 average concentrations was assumed to be insignificant. The weighted averages were
5 calculated by:
6

$$\bar{x} = \sum_{i=1}^t w_i \bar{x}_i \quad (C2-1)$$

7 where,
8

9 \bar{x} = weighted average
10 \bar{x}_i = average for WMCG i
11 w_i = weighting factor for WMCG i
12 t = number of WMCGs,
13

14 and \bar{x}_i was calculated by:
15

$$\bar{x}_i = \frac{1}{n_i} \sum_{j=1}^{n_i} x_{ij} \quad (C2-2)$$

16 where,
17

18 n_i = number of samples in WMCG i
19 x_{ij} = analysis j for WMCG i .
20

21 For several volatile organic compounds (VOC) (carbon disulfide, isobutanol, 1,1,2-
22 trichloroethane, trichlorofluoromethane, and vinyl chloride), headspace sampling data were not
23 available. The headspace concentrations of these VOCs for screening purposes and for
24 calculation of migration concentrations were assumed to be equal to one-half of the SQL. The
25 SQLs for these VOCs were calculated from information on the required method detection limits
26 (8 nanograms per 10-milliliter sample) contained in the *Transuranic Waste Characterization*
27 *Quality Assurance Program Plan Transuranic Waste Characterization Program Sampling and*
28 *Analysis Methods Manual*:
29

The SQL is the Method Detection Limit (MDL) expressed in part(s) per million per volume (ppmv). 1
2

$$SQL = \frac{R \times T}{P \times MW} \times MDL \times (10^6 \text{ ppmv/mole-fraction}) \quad (C2-3)$$

where, 3

SQL = sample quantitation limit for the VOC, ppmv 4

R = Ideal Gas Constant, 0.082 L·atm/mol·K 5

T = temperature, 298 K 6

P = pressure, 1 atm 7

MW = molecular weight of VOC, g/mole 8

MDL = method detection limit of VOC, g/L 9

The minimum, maximum, and median concentrations for each compound are shown in Table C2-3, separated by the waste matrix code. These values show that the distribution of data is not normal and, therefore, using the weighted average headspace concentrations in calculations is a conservative approach. 10
11
12
13

Table C2-4 contains the headspace gas data by drum number. 14
