1 **APPENDIX B7**

2 **PERMITTEE LEVEL TRU WASTE CONFIRMATION PROCESSES**

3 Introduction

4 This part of the Waste Analysis Plan (**WAP**) describes the actions that the Permittees will take to
5 approve and accept waste for storage and disposal at the Waste Isolation Pilot Plant (**WIPP**),
6 including waste confirmation activities.

7 The Permittees demonstrate compliance with the Permit by ensuring that the waste
8 characterization processes performed by generator/storage sites (**sites**) produce data compliant
9 with the WAP and through the waste screening and verification processes. Verification occurs at
10 three levels: 1) the data generation level, 2) the project level, and 3) the Permittee level. The
11 Permittees also examine a representative subpopulation of waste prior to shipment to confirm
12 that the waste contains no ignitable, corrosive or reactive waste; and that assigned Environmental
13 Protection Agency (**EPA**) hazardous waste numbers are allowed by the Permit. The waste
14 confirmation activities described herein occur prior to shipment of the waste from the
15 generator/storage site to WIPP.

16 B7-1 Permittee Confirmation of TRU Mixed Waste

17 Waste confirmation is defined in Module I as the activities performed by the Permittees to satisfy
18 the requirements specified in Section 310 of Pub. L. 108-447. Waste confirmation occurs after
19 waste containers have been certified for disposal at WIPP. The general confirmation process for
20 WIPP waste is presented in Figure B7-1.

21 B7-1a Permittees' Confirmation of a Representative Subpopulation of the Waste

22 The Permittees shall confirm that the waste contains no ignitable, corrosive, or reactive waste
23 through radiography (Section B7-1b) or the use of visual examination (Section B7-1c) of a
24 statistically representative subpopulation of the waste. Prior to shipment to WIPP, waste
25 confirmation will be performed on randomly selected containers from each CH and RH TRU
26 mixed waste stream shipment. Figure B7-1 presents the overall waste verification and
27 confirmation process.

28 The Permittees' waste confirmation encompasses ensuring that the physical characteristics of the
29 TRU mixed waste correspond with its waste stream description and that the waste does not
30 contain liquids in excess of TSDF-WAC limits or compressed gases. These techniques can detect
31 liquids that exceed 1 percent volume of the container and containerized gases, which are
32 prohibited from storage or disposal at the WIPP facility. The prohibition of liquids and
33 containerized gases prevents the storage or disposal of ignitable, corrosive, or reactive wastes.
34 Radiography and/or visual examination will ensure that the physical form of the waste matches
35 its waste stream description (i.e., Homogeneous Solids, Soil/Gravel, or Debris Waste). The
36 results of the Permittees' waste confirmation activities, including radiography and visual

1 examination records (data sheets, packaging logs, and/or video and audio recordings) will be
2 maintained in the WIPP facility operating record. Noncompliant waste identified during waste
3 confirmation will be managed as described in Section B7-2.

4 The Permittees shall randomly select at least 7 percent of each waste stream shipment for waste
5 confirmation. This equates to a minimum of one container from each fourteen containers in each
6 waste stream in each designated shipment. If there are less than fourteen containers from a waste
7 stream in a particular shipment, a minimum of one container from the waste stream shipped will
8 be selected. If the random selection of containers in a shipment occurs prior to loading the waste
9 containers into the Shipping Package, the randomly selected containers may be consolidated into
10 a single Type B package consistent with transportation requirements. Documentation of the
11 random selection of containers for waste confirmation will be placed in the WIPP facility
12 operating record.

13 B7-1a(1) Confirmation Training Requirements

14 Waste confirmation may be completed by performing actual radiography/visual examination on
15 the waste container(s) or by a review of radiography/visual examination media and records.

16 Waste confirmation personnel may be trained to either review of radiography/visual examination
17 media and records (Level 1) or to perform actual radiography/visual examination on the waste
18 container(s) (Level 2). Level 2 personnel may also perform waste confirmation by review of
19 media and records.

20 The Permittees management representative must be trained to the requirements of Level 2.

21 B7-1b Radiography Methods Requirements

22 Radiography has been developed by the Permittees specifically to aid in the examination and
23 identification of containerized waste. The Permittees shall describe all activities required to
24 achieve the radiography objectives in standard operating procedures (SOPs). These SOPs shall
25 include instructions specific to the radiography system(s) used by the Permittees at an off-site
26 facility (e.g., the generator/storage site). For example, to detect liquids, some systems require the
27 container to be rotated back and forth while other systems require the container to be tilted.

28 A radiography system (e.g., real time radiography, digital radiography/computed tomography)
29 normally consists of an X-ray-producing device, an imaging system, an enclosure for radiation
30 protection, a waste container handling system, a video and audio recording system, and an
31 operator control and data acquisition station. Although these six components are required, it is
32 expected there will be some variation within a given component between radiography systems.
33 The radiography system shall have controls or an equivalent process which allow the operator to
34 control image quality. On some radiography systems, it should be possible to vary the voltage,
35 typically between 150 to 400 kilovolts (kV), to provide an optimum degree of penetration
36 through the waste. For example, high-density material should be examined with the X-ray device
37 set on the maximum voltage. This ensures maximum penetration through the waste container.

1 Low-density material should be examined at lower voltage settings to improve contrast and
2 image definition. The imaging system typically utilizes either a fluorescent screen and a low-
3 light television camera or x-ray detectors to generate the image.

4 To perform radiography, the waste container is scanned while the operator views the television
5 screen. A video and audio recording is made of the waste container scan and is maintained in the
6 WIPP facility operating record as a non-permanent record. A radiography data form is also used
7 to document the Waste Matrix Code, ensure that the waste container contains no ignitable,
8 corrosive, or reactive waste by documenting the absence of liquids in excess of TSDf-WAC
9 limits or compressed gases, and verify that the physical form of the waste is consistent with the
10 waste stream description documented on the WSPF. Containers whose contents prevent full
11 examination of the remaining contents shall be subject to visual examination unless the
12 Permittees certify that visual examination would provide no additional relevant information for
13 that container based on the acceptable knowledge information for the waste stream. Such
14 certification shall be documented in the WIPP facility operating record.

15 For containers that have been characterized using radiography by the generator/storage sites in
16 accordance with the method in Attachment B1, Section B1-3, the Permittees may perform
17 confirmation by review of the generator/storage site's radiography audio/video recordings.

18 For containers which contain classified shapes and undergo radiography, the radiography will
19 occur at a facility with appropriate security provisions and the video and audio recording will be
20 considered classified. The radiography data forms will not be considered classified.

21 B7-1b(1) Radiography Training

22 The radiography system involves qualitative and semiquantitative evaluations of visual displays.
23 Operator training and experience are the most important considerations for ensuring quality
24 controls in regard to the operation of the radiography system and for interpretation and
25 disposition of radiography results. Only trained personnel shall be allowed to operate
26 radiography equipment.

27 The Permittee radiography operators performing waste confirmation shall be trained in
28 accordance with the requirements of Permit Attachment H1.

29 B7-1b(2) Radiography Oversight

30 The Permittees shall be responsible for monitoring the quality of the radiography data and calling
31 for corrective action, when necessary.

32 A training drum with internal containers of various sizes shall be scanned biennially by each
33 Level 2 operator. The video and audio media shall then be reviewed by a radiography subject
34 matter expert to ensure that operators' interpretations remain consistent and accurate. Imaging
35 system characteristics shall be verified on a routine basis.

1 Independent replicate scans and replicate observations of the video output of the radiography
2 process shall be performed under uniform conditions and procedures. Independent replicate
3 scans shall be performed on one waste container per day or once per shipment, whichever is less
4 frequent. Independent observations of one scan (not the replicate scan) shall also be made once
5 per day or once per shipment, whichever is less frequent, by a qualified radiography operator
6 other than the individual who performed the first examination. When confirmation is performed
7 by review of audio/video recorded scans produced by the generator/storage site as specified in
8 Permit Attachment B1, Section B1-3, independent observations shall be performed on two waste
9 containers per shipment or two containers per day, whichever is less frequent.

10 B7-1c Visual Examination Methods Requirements

11 Visual examination (VE) may also be used as a waste confirmation method by the Permittees.
12 VE shall be conducted by the Permittees in accordance with written SOPs to describe the
13 contents of a waste container. The description shall clearly identify all discernible waste items,
14 residual materials, packaging materials, or waste material parameters. VE may be used by the
15 Permittees to examine a statistically representative subpopulation of the waste certified for
16 shipment to WIPP to confirm that the waste contains no ignitable, corrosive, or reactive waste.
17 This is achieved by confirming that the waste contains no residual liquids in excess of TSDF-
18 WAC limits or compressed gases, and that the physical form of the waste matches the waste
19 stream description documented on the WSPF. A VE data form is used to document this
20 information. During packaging, the waste container contents are directly examined by trained
21 personnel. This form of waste confirmation may be performed by the Permittees at a
22 generator/storage site. The VE may be recorded on video and audio media, or alternatively, by
23 using a second operator to provide additional verification by reviewing the contents of the waste
24 container to ensure correct reporting.

25 In order to keep radiation doses as low as reasonably achievable at generator/storage sites, the
26 Permittees may use their own trained VE operators to perform VE for waste confirmation by
27 reviewing video media prepared by the generator/storage site during their VE of the waste. If the
28 Permittees perform waste confirmation by review of video media, the video record of the VE
29 must be sufficiently complete for the Permittees to confirm the Waste Matrix Code and waste
30 stream description, and verify the waste contains no residual liquids in excess of TSDF-WAC
31 limits or compressed gases. Generator/storage site VE video/audio media subject to review by
32 the Permittees shall meet the following minimum requirements:

- 33 • The video/audio media shall record the waste packaging event for the container such that
34 all waste items placed into the container are recorded in sufficient detail that a trained
35 Permittee VE expert can determine what the waste items are and their associated waste
36 material parameter.
- 37 • The video/audio media shall capture the waste container identification number.
- 38 • The personnel loading the waste container shall be identified on the video/audio media or
39 on packaging records traceable to the loading of the waste container.

- 1 • The date of loading of the waste container will be recorded on the video/audio media or
2 on packaging records traceable to the loading of the waste container.

3 The Permittees may also use their own trained VE operators to perform VE for waste
4 confirmation by reviewing VE data forms or packaging logs prepared by the generator during
5 their packaging of the waste. To be acceptable, the generator/storage site VE data must be signed
6 by two generator/storage site personnel who witnessed the packaging of the waste and must
7 provide sufficient information for the Permittees to determine that the waste container contents
8 match the waste stream description on the WSPF and the waste contains no liquids in excess of
9 TSDF-WAC limits or compressed gases. The Permittees will document their review of
10 generator/storage site VE data on Permittee VE data forms. Generator/storage site VE forms or
11 packaging logs subject to review by the Permittees shall meet the following minimum
12 requirements:

- 13 • At least two generator site personnel shall approve the data forms or packaging logs
14 attesting to the contents of the waste container.
- 15 • The data forms or packaging logs shall contain an inventory of waste items in sufficient
16 detail that a trained Permittee VE expert can identify the associated waste material
17 parameters.
- 18 • The waste container identification number shall be recorded on the data forms or
19 packaging logs.

20 VE video media of containers which contain classified shapes shall be considered classified
21 information. VE data forms will not be considered classified information.

22 B7-1c(1) Visual Examination Training

23 The Permittees' VE operators performing waste confirmation shall be trained in accordance with
24 the requirements of Permit Attachment H1.

25 B7-1c(2) Visual Examination Oversight

26 The Permittees shall designate at least one VE expert. The VE expert shall be familiar with the
27 processes that were used to generate the waste streams being confirmed using VE. The VE
28 expert shall be responsible for the overall direction and implementation of the Permittees' VE
29 program. The Permittees shall specify the selection, qualification, and training requirements of
30 the visual examination expert in an SOP.

31 B7-1d Quality Assurance Objectives (QAOs) for Radiography and Visual Examination

32 The QAOs the Permittees must meet for radiography and visual examination are detailed in this
33 section. If the QAOs described below are not met, then corrective action as specified in Permit
34 Attachment B3, Section B3-13 shall be taken.

1 B7-1d(1) Radiography QAOs

2 The QAOs for radiography are detailed in this section. If the QAOs described below are not met,
3 then corrective action shall be taken.

4 Data to meet these objectives must be obtained from a video and audio recorded scan provided
5 by trained radiography operators. Results must also be recorded on a radiography data form. The
6 precision, accuracy, representativeness, completeness, and comparability objectives for
7 radiography data are presented below.

8 Precision

9 Precision is maintained by reconciling any discrepancies between two radiography operators
10 with regard to the waste stream waste confirmation, identification of liquids in excess of TSDF-
11 WAC limits, and identification of compressed gases through independent replicate scans and
12 independent observations.

13 Accuracy

14 Accuracy is obtained by using a target to tune the image for maximum sharpness and by
15 requiring operators to successfully identify 100 percent of the required items in a training
16 container during their initial qualification and subsequent requalification.

17 Representativeness

18 Representativeness is ensured by performing radiography on a random sample of waste
19 containers from each waste stream in each shipment.

20 Completeness

21 A video and audio media recording of the radiography examination and a validated radiography
22 data form will be obtained for 100 percent of the waste containers subject to radiography.

23 Comparability

24 The comparability of radiography data from different operators shall be enhanced by using
25 standardized radiography procedures and operator qualifications.

26 B7-1d(2) Visual Examination QAOs

27 Results must be recorded on a VE data form. The precision, accuracy, representativeness,
28 completeness, and comparability objectives for VE data are presented below.

1 Precision

2 Precision is maintained by reconciling any discrepancies between the operator and the
3 independent technical reviewer with regard to the waste stream waste confirmation,
4 identification of liquids in excess of TSDF-WAC limits, and identification of compressed gases.

5 Accuracy

6 Accuracy is maintained by requiring operators to pass a comprehensive examination and
7 demonstrate satisfactory performance in the presence of the VE expert during their initial
8 qualification and subsequent requalification.

9 Representativeness

10 Representativeness is ensured by performing VE on a random sample of waste containers within
11 each waste stream in each shipment.

12 Completeness

13 A validated VE data form will be obtained for 100 percent of the waste containers subject to VE.

14 Comparability

15 The comparability of VE data from different operators shall be enhanced by using standardized
16 VE procedures and operator qualifications.

17 B7-1e Review and Validation of Radiography and Visual Examination Data Used for Waste
18 Examination

19 This section describes the requirements for review and validation of radiography and VE data by
20 the Permittees.

21 B7-1e(1) Independent Technical Review

22 The radiography and/or VE confirmation data for each shipment shall receive an independent
23 technical review. This review will be performed before the affected waste shipment is shipped to
24 the WIPP facility. The review shall be performed by an individual other than the data generator
25 who is qualified to have performed the work. The review will be performed in accordance with
26 approved Permittee SOPs and will be documented on a review checklist. The reviewer(s) must
27 approve the data as evidenced by signature, and as a consequence, ensure the following:

- 28 • Data generation and reduction were conducted in a technically correct manner in
29 accordance with the methods used (procedure with revision). Data were reported in the
30 proper units and correct number of significant figures.
- 31 • The data have been reviewed for transcription errors.

- 1 • Radiography video and audio media recordings have been reviewed (independent
2 observation) on a waste container basis at a minimum of once per shipment or once per
3 day of operation, whichever is less frequent. The radiography video/audio recording will
4 be reviewed against the data reported on the Permittees' radiography form to ensure that
5 the data are correct and complete. If review of radiography scans recorded by the
6 generator/storage site was used to perform confirmation, two observations must be
7 performed for each shipment or two observations per day, whichever is less frequent.

8 B7-1e(2) Permittee Management Review

9 The radiography and/or visual examination data for each shipment shall receive a Permittee
10 management review. This review will be performed before the affected waste shipment is
11 disposed of at the WIPP. The review shall be performed by a designated member of Permittee
12 management. The review will be performed in accordance with approved Permittee SOPs and
13 will be documented on a review checklist. The reviewer(s) must approve the data as evidenced
14 by signature, and as a consequence, ensure the following:

- 15 • The data are technically reasonable based on the technique used.
- 16 • The data have received independent technical review.
- 17 • The data indicate that the waste examined contained no ignitable, corrosive, or reactive
18 waste and that the physical form of the waste was consistent with the waste stream
19 description in the WSPF.
- 20 • QC checks have been performed (e.g., replicate scans, image quality checks).
- 21 • The data meet the established QAOs

22 Upon completion of the Permittee management review, the waste confirmation data for the
23 shipment shall be submitted to the WIPP facility operating record as non-permanent records.
24 Waste confirmation data includes radiography and VE data forms, video/audio media, and
25 review checklists.

26 B7-2 Noncompliant Waste Identified During Waste Confirmation

27 If the Permittees identify noncompliant waste during waste confirmation at a generator/storage
28 site (i.e., the waste does not match the waste stream description documented in the WSPF or
29 there are liquids in excess of TSDF-WAC limits or compressed gases) the waste will not be
30 shipped. The Permittees will suspend further shipments of the affected waste stream and issue a
31 CAR to the generator/storage site. Shipments of affected waste streams shall not resume until the
32 CAR has been closed. NMED will be notified within 24 hours of any suspension of waste stream
33 shipments due to the identification of noncompliant waste during waste confirmation.

1 As part of the corrective action plan in response to the CAR, the generator/storage site will
2 evaluate whether the waste characterization information documented in the Characterization
3 Information Summary and/or WSPF for the waste stream must be updated because the results of
4 waste confirmation for the waste stream indicated that the TRU mixed waste being examined did
5 not match the waste stream description. The generator/storage site will thoroughly evaluate the
6 potential impacts on waste that has been shipped to WIPP. The Permittees will evaluate the
7 potential that prohibited items were shipped to WIPP and what remedial actions should occur, if
8 any. The results of these evaluations will be provided to NMED before shipments of affected
9 waste streams resume. If the Characterization Information Summary and/or WSPF requires
10 revision, shipments of the affected waste stream shall not resume until the revised waste stream
11 waste characterization information has been reviewed and approved by the Permittees.

12 If a generator/storage site certifies noncompliant waste more than once during a running 90-day
13 period, the Permittees will suspend acceptance of that site's waste until the Permittees find that
14 all corrective actions have been implemented and the site complies with all applicable
15 requirements of the WAP.
